Commodore Annual 1990

Word Processing | Guide to Communications
Comprehensive Software Guide | User Groups
Commodore in Education | Australian BBS List

HOME COMPUTING started out with machines you had to build yourself. These computers were no simple kit you merely screwed together. Every component needed to be soldered into place. Times progressed, and mass produced models appeared. Commodore, Apple and Sinclair paved the way for many budding computer hacks to venture into the land of BASIC and machine code programming.

Owning a home computer in those days was all about learning how it worked, and getting in and fiddling with the operating system as much as possible. Today, computer technology at both the hardware and software level has advanced past the scope of most home users. The days of knowing your machine upside down and inside out are gone.

The Commodore 64 has now survived close to a decade. It remains the one home computer you can buy, and look forward to tinkering with at the lowest levels without a degree in computer engineering.

There are plenty of off-the-shelf programs to make using your C64 for practical and entertainment reasons easy. With so many years life behind it, the C64 has amassed a huge range of programs, though some of the earlier titles may no longer be available. We have compiled a complete list of all those programs which can be purchased locally - see the Software Guide in this Annual. If the program you're looking for is not on the list, you may not be able to buy it in Australia. However, you are sure to find a similar one.

We hope you enjoy our 1990 Annual. Don't forget, more articles like those in this publication appear every month in *The Australian Commodore and Amiga Review*. ❏

Andrew Farrell
Editor

THERE ARE MANY computer companies in the marketplace, each trying to carve out their own little "niche". Some concentrate on games machines - others the top end of the home market, home offices, and so on. Others look at small business, while yet others are after the large corporations, government and professional users.

There is only one company which covers *every* section of the marketplace. That company happens to be the world's largest manufacturer of computers.

Of course, it's Commodore.

The Commodore 64 covers both the games and the home computer market. In fact, this remarkable machine is the world's largest selling individual model - over seven million of this one machine have been sold!

For small business, we have both the PC range and the amazing Amiga. Commodore top-end PC models, and the Amiga 2000 and 2500 cover the corporate and government market.

For end users, the wide Commodore range has particular benefits. Software applications are available to suit virtually every application you can imagine. Also, because of volume, prices of software for Commodore machines are often lower than for others.

We also benefit from economies of scale in our manufacturing that others cannot hope to achieve.

And because of such a huge user base, support groups and companies for Commodore computers offer those extra services that no computer company itself can provide.

Where do we go in the next year?

We see that Commodore will continue to dominate the home computer market, and gain an increasing share of the business, corporate and professional market. The Amiga and our PC range are already widely used in business, and becoming more so every day.

As technology advances (which it continues to do at an ever-increasing rate), Commodore Computers will be right up there with it.

As you would know, Commodore Computers are sold right around the world (over 51 countries, to be precise!). World-wide, the company has enjoyed excellent results over the past year, with the Australian results right at the top.

For this, I personally thank you.

Indeed, every member of the Commodore staff, the 1500+ dealers and their staffs, software and hardware suppliers, and so on, thank you.

By supporting Commodore you are helping to keep thousands of other Australians, and their families, housed, clothed and fed. That makes you pretty important to all of us!

If we at Commodore ever do anything that makes you think you're not important, please let me know. ❏

Pat Byrne,
Managing Director,
Commodore Business Machines Pty Ltd.

Starting the right way!

by Andrew Farrell

Home computing has the potential to be a lot of fun. The right software and the right advice will ensure you end up with a system you understand and can enjoy using. A few wrong decisions can mean problems.

TAKE THE TIME to understand the technology you're using and you will find it far more rewarding. The recommendations of our regular monthly magazine, *The Australian Commodore and Amiga Review* will make more sense - as will the rest of this publication.

You've just recently bought your home computer. The user manual is sitting there unread. Too many daunting terms? Can't quite make sense of it all?

Explaining computers is not easy. In day to day life, you'll rarely come across many of the terms or concepts of computing. So, part of the trick of understanding it all is to try and find parallels with parts of technology you do deal with every day. Surprisingly, there are many similarities. So, here goes. An easy-does-it approach to all the jargon!

Hardware vs software

● Lesson one. If you can kick it, it's hardware. Everything from the computer itself, to the many appendages we can connect to it. The nuts and bolts, silicon and plastic are the hardware. A printer,

Commodore 128

disk drive, terminal, visual display unit or plug-in games cartridge is hardware.

Software is a little trickier. You can't see it, although you can see where it lives. Software refers to the instructions that a computer understands when arranged in a special order referred to as a program. The words program and software are interchangeable. Don't say "software program" - you might just as well be saying "automobile car"!

Putting information into a computer is NOT programming it. Preparing a list of commands or special instructions for the computer to execute is. Both programs and information reside safely in the computer's memory, and on floppy disks or other storage media.

Floppy disks aren't to be flopped!

● The concept compares well with the home sound system. Imagine that the record player, cassette deck, or CD player are the hardware of your computer system. The cassettes, CDs and records are equivalent to the floppy disks or cassettes used in your computer. There is one fundamental difference. As you play a track off your favourite record, the music is picked up by the needle, and played through the amplifier. The music never actually leaves the record, and you need the record to play the music.

Insert a disk into your computer, and you must LOAD or transfer the program into the computer's memory. A small head, similar to the head in a cassette player, reads the information from the disk. The program remains on the disk it was on, but a copy now resides within the computer itself. The instructions contained within the computer's memory, or

RAM, are then executed.

You can see the results on your screen, or printer, but the program itself is really just a series of electrical impulses. Since the program is safely tucked away in the computer's memory, which is quite large, you can remove the disk.

Some programs access the disk, retrieving small amounts of information each time, and updating data already stored. For these programs, you must be very careful not to remove the disk until all processing has finished.

Meet RAM & ROM

● Inside the Commodore 64, specialised silicon chips perform specific jobs. Each chip is encased in black plastic, with many small legs. Inside this largish rectangular shape is the silicon chip itself, which is only the size of your smallest fingernail. Computer programs and information are stored in these chips. Two types are used in particular.

Random Access Memory is the computer's workspace. Information is stored and can be changed in RAM. RAM is divided into bytes, each of which can store one character. A character could be any letter of the alphabet, or perhaps a number or special symbol.

Each byte or character (letters and numbers) is in turn broken down into BITs. Each BIT corresponds to a transistor inside a silicon chip. Transistors may be either off or on, just like a simple switch. By combining several transistors together, it's possible to produce different combinations of offs and ons.

With eight transistors there are 256 different combinations, or ways of arranging the ons and offs. Your eight BIT Commodore has eight bits in each byte.
Silicon Chip

Larger computers use sixteen or even thirty BITs in each BYTE and can move information around quicker.

One thousand and twentyfour bytes make a KILOBYTE, or K for short. A Commodore 64 has 64 Kilobytes of RAM, or workspace. Deep inside, computers work using a number system called BINARY. In the early days, to program and use a computer you needed to know how to use Binary.

Today, only application programmers and the people who design the system software or operating system of a computer need ever deal with this counting system.

Like RAM in all respects except that it can't be erased, or written to, ROM is a permanent means of storing information. Programs required by the computer to do simple tasks are often stored in ROM. For example, to print a character on the screen, a special routine or small program is stored permanently in the computer's ROM. Any other program needing to print a character on the screen could then make use of that routine.

Many thousands of routines go to make up the computer's OPERATING SYSTEM or built-in languages. Commodore have designed a special ROM in the C64 called the Kernel. Many programs used the routines in this ROM to perform simple tasks such as talking to the disk drive, editing text or multiplying large numbers. Without these inbuilt routines or programs, software would take up much more space, be more expensive and more difficult to write.

Out on the peripherals

● Most computers enable you to add a variety of additional devices for storing information, printing it out, or performing special tasks. These devices are called peripherals. They combine to make a computer into a system, much the same as the various attachments to a food processor. Although the food processor works on its own, the additional plug-in items enhance its operation, just like the computer and its peripherals.

A few commonly used peripherals and hardware add-ons include:- Disk Drive, 1351 Mouse, Expansion RAM, Printer, Paddle, Modem, Joystick, Touch Pad, Monitor, Track Ball, and Parallel Interface.

A disk drive is like a combination of your record player and cassette deck. Information is stored magnetically, like a
Commodore C64

cassette. However it is stored on a disk, like a record.

The disk is divided up into tracks. Each track forms a complete circle, unlike those on a record which spiral toward the centre. Tracks are then divided into parts called sectors.

A blank disk must first be formatted before use. During this operation, the tracks and sectors are labelled, and a directory is stored on the disk telling the computer where there is space to store information.

The way in which different Operating Systems label each track and sector varies. For this reason, it's not always possible to take information stored on a disk by a certain computer, and read it from a different machine.

This problem is often described as the "compatibility" of a machine. If a computer can read and execute programs stored on IBM PC type formatted disks, it is known as an IBM compatible computer. Commodore PC's are IBM compatible. The C128 can read and write C64 disks and execute C64 programs, so it is C64 compatible. However, there is no similarity between IBM disks and C64 disks, although the 1571 disk drive with the program *Big Blue Reader* can be made to read text files from IBM format disks.

However, there is more to compatibility than simply getting the files or programs to the different disk format. Software written to work with one particular microprocessor will not work on a computer with an incompatible microprocessor. The microprocessor is the brain at the heart of your computer. The C64 uses the Motorola 6510. The IBM PC uses a Intel 8088. These processors are very different. Unless the program is written in a high level language, there is no easy way to transfer programs intended for one microprocessor to another.

On your disks ...

● Information stored on a disk is grouped into files. Each file has a name, length, and type. A file might contain text relating to a wordprocessing document. Files may also be programs, a database, lists or special numbers.

By arranging information in this way, the disk operating system knows how all the information on the disk relates. Without the file arrangement, each sector on the disk would be meaningless. Whenever a file is stored on a disk, its name is recorded in the disk directory. This is just a list of the disk's contents, including whereabouts files can be found, how long they are and what type of file it is that is stored.

If you need to know what is on the disk, it is normally possible to take a look at the disk directory. Files may be deleted or erased. When this happens, the directory entry about that file is removed, freeing space for other information. However, until the disk is written to, the information relating to that file is still scattered around the disk.

You may also copy files from one disk to another, on the same disk or even entire disks at a time. The process of getting a file into the computer is referred to as LOADing or reading that particular file. In some instances you only use part of a
Commodore MPS 1250 Dot Matrix Printer

Commodore C64 in replacement case

Nettcomm Modem

file at a time. For example, if you had a database or list of phone numbers, along with the subscribers' addresses and personal interests, the resulting file would be 'very large.

If you wanted information about one particular person, it would be wasteful to have to LOAD the entire file into memory. Instead, a special pointer is used to jump into the file to the right spot where the required details are stored. Only that part of the file is then read, and may be changed and updated. This is called RANDOM ACCESS.

Madam my Modem

● A modem is used to send information between computers, via telephone. Data is changed into audible beeps and tones, which is then decoded by the receiving computer. This process is known as MOdulation/DEModulation - thus the term MODEM. Communications between computers is an exciting field. It makes possible some very powerful facilities. Automatic Teller Machines are linked together using modems.

At home, a small $300 modem can enable you to talk with services offering banking, stockbroking, weather reports, TAB, hotel/motel and travel bookings and much more. Information is sent at different speeds, measured in BITs per second, or BAUD. Rates of 300, 1200 and 2400 baud are fairly common. 300 baud is about as fast as you can read, or around 30 characters per second. (See "A Hitch-hikers Guide to Telecomputing" on page 22).
Commodore C64 with monitor and disk drive

Making it tick

● For a computer to perform even the simplest of tasks, it needs software. When you switch on, a special program built into a ROM in the computer, comes to life. It checks how much memory is available, what peripherals are connected, and displays a power-up message. This program is part of the computer's operating system, or group of programs that let you use the computer. Examples of operating systems are MS-DOS, Unix, CP/M, and Amiga DOS.

The word DOS stands for Disk Operating System. This denotes that the operating system is disk based. In other words, you need a special disk and disk drive to make it work.

Different operating systems require different commands to perform a job. On some small computers, the operating system is part of the builtin programming language.

A Commodore 64 has the BASIC (Beginners All Purpose Symbolic Instruction Code) programming language, and operating system stored entirely in the computer's 16K ROM. No disk or disk drive is needed. Information can be stored on cassette. On the Commodore Amiga the operating system is capable of doing several jobs at once. It also has a variety of modes of operation. Using the Workbench, commands are issued by way of a pointer called the MOUSE. Pictures and menus on the screen provide the various options available.

It's not necessary to know how to program a computer to be able to use one to the full. However, if you plan writing your own custom applications, learning to program is an essential step. A program language is structured much the same as the different languages we speak. Each has its own set of words, or commands and statements, with special rules of grammar, or ways as to how they can be combined.

Most home computers provide BASIC for you to write programs in. This language is fairly easy to get started in, and is suitable for many different uses.
Around the keyboard and screen

● The computer's keyboard and screen are an important part of any computer system. Using the keyboard, the user can write programs, enter information, and send commands to peripherals. Additional devices are also used to control the computer, such as a Mouse, Light-Pen, or Touch Screen.

Every key press is sent to a small buffer or temporary storage area. From here it is fetched as soon as the program running is ready to use it. Sometimes it's possible to type ahead of the computer. Because of this buffer, your keystrokes aren't forgotten.

The keyboard itself is much the same as a standard typewriter. It is called a QWERTY keyboard, due to the arrangement of the first five characters on the top row of alphabet keys. The keyboard we use today was actually designed to slow down our typing speed. When typewriters were first invented, typists found that they could type faster than the mechanics of the typewriter were able to cope. So the keyboard was changed to slow them down. Today, we use the same layout, despite far better arrangements being available, such as the DVORAK keyboard.

Instead of a carriage return lever, the computer keyboard has a return key, just like an electric typewriter. There's also function keys, to perform special jobs. Other keys provide the ability to stop, or pause programs, or quit out of what you're doing.

A small flashing square on the screen shows where the next character you type will appear. This is called the cursor. The screen is divided into rows and columns. On an IBM compatible there are normally 80 columns and 25 rows of characters.

Smaller home computers have only 40 columns.

Sometimes the screen display will scroll, either up or down to allow a new line of text to be displayed. Each time the display scrolls, an entire row of characters moves off the screen. Computers are also able to display graphics, by dividing the screen into individual dots instead of characters. Each of these dots is called a PIXEL or Picture ELement.

What about graphics?

● Probably the most entertaining reason for owning a Commodore 64 is its graphics capabilities. Although you're probably thinking graphics are only good for games, they do in fact make many other programs possible. Instead of being restricted to the pre-defined character set stored in the C64's ROM, you can display just about any shape you want.

The computer screen is divided into small dots. These are called PIXELS, or Picture Elements. Each of these dots corresponds to a BIT inside the computer's memory. By switching Bits off and on, the image displayed is varied. Done quickly enough, you can even produce animation.

The number of Pixels displayable on the screen is called the resolution. Several resolutions are available, normally expressed as the number of dots horizontally by the number of dots vertically. A Commodore 64 has a 320 x 200 pixel graphics display, using two colours in every 8 x 8 square. This mode is called hires mode, or high resolution graphics. In another mode, greater colour availability is possible by halving the horizontal resolution to 160 pixels.

The Commodore 64's VIC11 chip can also produce small shapes. Once defined, these may be very easily moved, animated and displayed. They are called Sprites. A sprite is 24 x 21 pixels in size. They move independently of the main picture. Furthermore, collision detection between different sprites is possible. Many games use these facilities. Sprites are one of the most powerful features available to the games designer. Most arcade quality computers allow at least eight, if not 16 different sprites on the screen at one time.

And some colour too!

● Your Commodore 64 can generate 16 different colours. Although, by alternating between two colours every second

pixel, it is possible to give the impression of shades or mixtures of colour. More powerful computers such as the Amiga also allow a variation in the hue or intensity of each colour.

Pictures may be recorded by computers digitally. Using a video camera, the image is turned into a series of dots that are either off or on - corresponding to the computer's ability to store information. The resulting picture looks very similar to newspaper quality photographs.

My SID chip

● Computers can synthesize music in much the same way as an organ or professional synthesizer. Sound is formed by vibration. This action can be simulated in the computer, along with the timbre and pitch of each note. More powerful machines have several voices enabling them to play a number of different notes simultaneously.

Music can also be recorded into the computer's memory digitally, just like a Compact Disc. The result sounds very much like normal music played from a record or cassette. The quality of digitised music depends on the amount of memory used to store the sample. The more memory used, the better the quality.

It's also possible to connect an external keyboard to the computer using a MIDI interface. Information sent from the keyboard as music is played is then able to be recorded using the computer. Later on, the music can be replayed and a new track recorded over the top of the first. Professional musicians make strong use of these facilities.

Computers cannot write the music for you, but they can sure make writing music far less laborious. A single musician has at his disposal many powerful

facilities normally only possible in expensive recording studios.

Software is available enabling budding musicians to cut and paste notes onto a stave. The result can be played on the computer or printed out into sheet music.

In the Commodore 64 the SID chip, or Sound Interface Device, produces three voice harmony which is as good as some low end synthesisers costing twice the price. Dr T's Music series offers plenty of power in this area - get hold of *Electrosound* too if you can.

On the desktop

● The biggest buzz word of the eighties was "desktop". If you could do it on a desktop it was all the rage. Desktop publishing, desktop video and desktop operating systems with fun little gadgets like calculators, notepads and the like.

Your Commodore 64 is well catered for in the desktop environment by *GEOS*. See the article on *GEOS 2.0* for further information.

In essence the term "desktop" simply means everything happens on screen, in such a way that previously manual tasks are replaced. In desktop publishing for example, you no longer need to cut and paste columns of text and add pictures later. Everything is done on the spot - your finished page looks finished on screen and comes out of your printer ready to go to the printers!

The future of the C64

● I am glad to see that there is still a place in the market for the C64. It is now the grandfather of the Commodore range, but is a wonderful machine to start with, providing the first time user with a good grounding in the basic concepts of contemporary home computing.   ❏
Arkanoid (Entertainment)

A guide to Computer terms and keyboard characters

● EVER WONDERED how to explain which tricky symbol you mean to a fellow Commodore user? Wished you sounded like you knew what you were talking about? Here's a few tricky symbols, along with the correct name for each. Now you can sound like a real expert. We all know what an expert is, right? (An "ex" is a has been, and a "spurt" is a small drip under pressure.) So now you know.

!	-Exclamation mark
@	-At sign
#	-Hash
$	-Dollar
%	-Percentage
^	-To the power of or CTRL
&	-Ampersand
*	-Asterisk or Times
(	-Left round bracket
)	-Right round bracket
[	-Left square bracket
]	-Right Square Bracket
{	-Left curley bracket
}	-Right curley bracket
"	-Inverted commas
'	-Single comma
:	-Colon
;	-Semi-Colon
,	-Comma
.	-Full-Stop
/	-Forward slash or divided by
\	-Reverse slash
-	-Minus or dash
+	-Plus

● USING A COMPUTER means using a lot of words which are foreign to most people. In fact, most people only use about 600 words on a day to day basis - so it's little wonder all those new computer terms can be hard to come to grips with.

Why is there so much terminolgy to know? Well, it makes sense to use a brief term rather than the full explanation every time. For example "DISK" saves you having to say "Magnetically charged particle coated plastic platter" ...

Abort: Panic! Stop an operation during mid flight. Abort a file transfer would mean prematurely stopping the process.

BASIC: Beginners All Purpose Symbolic Instruction Code. A language used for programming home computers, similar in some areas to English. BASIC is built in to the Commodore 64 in a 8K ROM.

Characters: The letters, numbers, punctuation and other special symbols produced by a computer.

Cursor: Square or line, usually flashing, which marks the position that the next character will be printed at.

Disk: A round magnetically coated flat platter for storing information on magnetically.

Expansion: The ability to add additional hardware to the computer, such as memory (RAM).

Joystick: Controller for games, drawing and graphics programs which has five switches (sometimes more). Up to nine directions may be read.

Keyboard: What you type on.

LIST: Display a program in BASIC. Also lists a disk directory after the LOAD"$",8 command.

LOAD: Transfer a program from a storage device such as tape or disk, to the computer.

Monitor: Screen or display for viewing the computer's output. A monitor is of higher quality than a normal colour television. Text based applications such as wordprocessing are best carried out on a monitor.

Port: A socket or connection for adding a peripheral such as a joystick. There are two joystick ports on the right hand side of the computer.

RAM: Random Access Memory. The work space of your computer. All information in RAM is lost when you switch off the power - which explains why you need some form of storage such as a disk drive.

ROM: Read Only Memory. Similar to RAM, except permanent. ROM cannot be altered, and remains intact even without any power. The Commodore 64 contains two 8K ROMS.

Return: Also known as enter. Pressing this key tells the computer you have finished typing.

Screen: Same as monitor or display or television.

Syntax: The grammatical arrangement that the computer understands. A syntax error means you've made a typing mistake or entered something the computer doesn't understand at all.

SAVE: Store a program on file on disk, tape or any other form of storage.

Getting into Graphics with
Animation Station

by Andrew Farrell

W HEN THE COMMODORE 64 was first launched its graphics capabilities were one of the most heralded improvements in home computer technology. Indeed, it remains the most inexpensive, reasonable quality graphics computer on the market. With a resolution of 320 x 200 using 16 colours it is well suited to drawing and design for the home user without the necessity for an expensive colour monitor.

Back in the early days, Micro-Illustrator paved the way for the Koala Graphics Tablet to establish itself at the standard by which other programs were measured. In the heyday of the C64, there was at least a dozen excellent programs available for painting. One of the best was the *OCP Advanced Art Studio*, which unfortunately has recently become unavailable in Australia.

Nevertheless there is still a good selection of packages, although some of these may only be available through User Groups. Apart from *GEOS*, the Ani-mation Station would probably be the best alternative to some of the earlier successes. The package makes use of the original Koala Pad technology now licensed to Suncom. The software which enables the user to record his designs on the computer is the same, exactly, as *Blazing Paddles*. This program has been available for some time and is a tried and tested product. So, let's take a look and see just what you can do with *Blazing Paddles* and the touch tablet.

Inside the box

● Inside the hefty box is a disk, small 32 page manual, the touch tablet and stylus. The tablet has a grid on it and four buttons - two on each side enabling either left or right handed people to use it. According to the box, the Animation Station now works with the Commodore 1525, MPS 801, 802, Gemini 10X, 15X, Epson 80, 100, Okimate and with a Ruscard or Cardco Interface. Quite likely it would work with other interfaces such as the Xetec Interface and other printers which are compatible with the above listed.

The beauty of this product is that the touch tablet can be used with various other programs, including *GEOS*. It is a very intuitive method of inputting designs into the Commodore 64. The pad allows you to work in much the same way as you would when drawing normally.

A pressure sensitive surface, with a somewhat useless grid pattern, is activated by a blunt stylus instrument. This returns a value to the paddle port, joyport one, on the Commodore 64. The signal is actually a voltage range which when converted by the analogue to digital converter in the C64, returns a value between one and 255. Using this method, the tablet enables a pointer on screen to be moved smoothly and artistically. Unfortunately, due to the nature of the pad, some jitter is likely. As a menu selector, the pointer method is especially easy to understand, and is the basis for more advanced operating systems such as that found on the Commodore Amiga.

Main menu

● Once you've booted up the software you'll be confronted with 18 menu options. Each of these options is represented by an icon and can be selected by simply positioning the pointer over the icon and pressing one of the buttons on the pad. When the pointer is at the top left corner of the pad, it is not necessarily at the top left corner of the screen. You may find that only an area within the pad actually actuates the pointer on the screen.

From the main menu you can carry out just about all of the available options. Anything from clearing the screen, drawing a filled or hollow oval or box, sketching, drawing dots (in other words a spray paint type effect), lines, joined lines, you can choose different colours, fills, sprays, you can zoom, select to print the picture, load a picture from disk, you can also access various shapes and position text on the screen.

It's pretty easy to work out what all these options do. However there are a
Main screen

few hidden intricacies which require a little extra reading. Colour selection for example. Here there are two possible modes of operation. Bit Optimization and Register Selection. When you choose the colour function you can then select which mode to work with. Sixteen boxes display the possible colours available, and an additional two boxes allow you to then select two colours which you may optionally mix if required.

Having selected which colour you wish to work with the next step is to choose a brush, there are eight in all. Anything from a single one dot brush up to a large square. When you are drawing lines it's good to keep in mind that best results are obtained by using a small brush as the larger brushes produce a rather ragged look. The sketch option allows you to actually draw in freehand as if you were drawing on a piece of paper. By careful use of the stylus and applying constant pressure reasonably good lines can be obtained. However, often the result is a little bit jerky and will require additional work in order to clean it up.

You can also draw boxes very easily and fill them with a solid colour or texture as chosen from the colour option. Some care must be taken to ensure the fill is not going to leak at some point. You may also draw ovals or circles using the oval function. Filled ovals are also possible. By adjusting the height to width ratio all different size convoluted ovals or circular shapes may be constructed.

To give texture or solidarity to an object the dots option may be used, however for the most interesting effects, the airbrush function is excellent. As the name suggests this facility simulates a real air-
Juggler Animation

brush, literally spraying colours one on top of the other. You can move backwards and forwards over an area to gradually increase the amount of colour sprayed.

Rubber banding

● When drawing ovals, boxes or lines a rubber-banding effect takes place enabling you to see whereabouts your draw will be positioned. Using the multiple lines option it's easy to draw polygons of any size or nature.

Once you've got the rough for your drawing in place, it's time to go in with zoom mode and pretty the drawing up. In this mode approximately one third of the screen becomes a large window magnifying the area at which the cursor was positioned. You can move the zoom lens around by positioning the stylus on one of the edges of the pad in the direction to which you wish to move.

One thing to watch out for is the unusual arrangement of colours on the Commodore 64 when using multi-colour mode, which may be disturbed when you edit an image at the pixel by pixel level.

Of course if you're preparing different types of drawings on a regular basis you'll soon find various shapes which you often use. Animals, trees, cars or people can be constructed as shapes and saved into a Shapes Library. These may then be manipulated, flipped, rotated and edited prior to being positioned in a new picture.

Fancy writing!

● For presentation work or building educational pictures the text option is very useful. You enter the text on the

screen in the same fashion as you would into a wordprocessor using the keyboard and the delete key will delete characters. Once you've finished, press return and the text is permanently written to the screen.

The end result of all your hard work can easily be manipulated using window. A window may be made around any portion of the screen at which time two additional options will appear, cut and paste. A selected area may be copied to another part of the screen, saved to disk or you can clear the screen and repaste it on by itself. You can also add it to other pictures.

One of the best parts about Animation Station is if you make a mistake you can always undo it using the undo button on the pad. When you've finally got it right and there's no more mistakes, it's time to save it to disk. The disk option allows you to format a new data disk ready for pictures. I found the menu facility was a little clumsy, however once you get the hang of using the pad it's relatively simple to select file names and other options.
Design Lab allows a number of possible character sets to be used from the Disk Utilities screen. You can load a new character set for use when operating the text option.

And what good would all your hard work be if you couldn't get a hard copy? The printer allows you to produce printouts of your picture in either positive or negative format. A variety of different printers are supported.

BASIC support

● At the back of the manual there is a interesting section dealing with using your pictures in your own basic programs. A program displaybas is included on the disk to enable you to work out just exactly what must be done. You can even import Koala Pad pictures into the Animation Station software to edit them for later use. For Commodore 1526 printer owners a separate program, Dump 1526, enables you to print graphics too.

Overall the Animation Station is a good, middle of the road graphics package which, thanks to its availability and very useful touch tablet, is probably the most functional graphics program available at this time. Even if you can get your hands on better software, the tablet alone is well worth the price. The tablet should work with any program that worked with the Koala Pad, a trackball or paddles.

Thank you to Computermate (02) 457-8118 for rushing over our review model at the last minute - RRP $139. Available from most good computer stores.

Best Points	Worst Points
● Icon driven menu system	● Jitter when drawing
● Easy to use	● Poor feel to pad buttons
● Zoom mode	● Software is a little dated
● Text and Shapes	

Graphics Glossary

Clip-Art: Small clippings or shapes cut from larger images used to paste into larger designs.

Cut & Paste: Literally emulate the process on screen to the image displayed of cutting with scissors and then pasting with glue.

GEOS: Graphic based operating system using windows, icons and a pointer. (See article on page XX.)

Graphics Tablet: Pressure sensitive input device returning X, Y co-ordinates to the software.

Icon: Picture representing an available process, or resource such as a disk or printer.

Interface: Device which enables otherwise incompatible hardware to communicate. Especially used between Centronics type parallel printers and the Commodore serial port.

Joyport: Connection on the right side of the C64 allowing input from various hand controllers. Joyport one enables not only joysticks, but paddle type devices returning a variable voltage range or X and Y value.

Menu: List of choices.

Pixel: Picture Element or BIT or dot on the screen.

Resolution: The amount of detail possible. Normally this is referred to as an X by Y resolution of pixels or dots.

Window: An area on the screen which may be worked within independently. Scrolling, editing and other action do not affect the rest of the screen.   ❑

Which Cartridge?
Expert 4.1R vs Super Snapshot V4.0

by Eric Holroyd
I T SEEMS TO us here at *Australian Commodore and Amiga Review* that these two units are the front runners in the field of all-purpose cartridges for the Commodore C-64. We don't hear much of the others of their type nowadays, and it appears that "the best have outlived the rest." (Our old favourite, the Action Replay V is very hard to come by.)

Both units have a vast range of useful utilities including: Backup of memory resident programs; Machine code monitor; Graphics capture; Disk drive speed-up; Sprite functions; Printout facilities; DOS wedge of "shorthand" disk commands.

Both are reasonably priced and good value for money. The two cartridges have been previously reviewed in the pages of the *Australian Commodore and Amiga Review*, along with updates of both as they've been released.

It's interesting to note that these two "survivors" are the only "upgradable" units of their type, although each unit does it rather differently.

The Expert itself is a programmable cartridge which gets its program code from disk with the user selecting the required function to be loaded into the cartridge. Super Snapshot, on the other hand, has all of its code on a ROM chip which is replaced at upgrade time with a new ROM.

Manual revisions are supplied with each upgrade also.

In the belief that many readers will already have knowledge of both products via the reviews already published (and newer readers can get the relevant back issues by calling 02-398-5111) I'll just get straight onto a listing of some of the features of each cartridge. See "Cartridge F eatures".

Accounts and invoices from goods suppliers sometimes carry the legend "E.& O.E.", which means "Errors and Omissions Excepted. I should invoke the same thing here as it's quite a task going through all the wonderful features on of-

fer from each cartridge.

Sharp-eyed readers will have noticed several "Optional" brackets against some of the Expert's features in the list above. These are functions available on the separate Utilities Disk which is available from the same supplier.

Super Snapshot has one optional extra listed, and that is the SlideShow Maker. This is well worth getting as it lets you set up a show of a series of pictures which will load in automatically with several different "wipes" and "fades" to choose from, display for whatever length of time you wish, and also have an optional scrolling message in your choice of screen position and in any one of nine fonts.

Other Super Snapshot utilities, such as the parameter copier, bootsector maker, Turbo*25 disk creator etc, come on the System Disk provided with the cartridge. The Sprite Editor is on the system disk and is called SS.SED. There's a slideshow on the back of this disk. I got a second disk with my V4.0 Super Snapshot too, it had several extra utilities for graphics manipulation (such as OCP Convert), colour printer drivers, and a "Readme" file to explain it all.

I'm not a machine code (or even a BASIC) programmer so I can't really tell you too much about the operations of each systems ML Monitor. I know a couple of 64 hackers who swear that the Expert's monitor is the best thing since sliced bread but then again I can think of others who reckon Super Snapshot's monitor is the one to use. One thing's for sure, the manuals for both units have long lists of monitor functions and they both seem pretty comprehensive to me.

What it all boils down to is that it's up to you, the buyer, to evaluate all the features and decide which one will suit you best. As regards all the other functions such as disk drive speedup, DOS wedge, screen copy etc, both units perform well with one outshining the other on one feature, only to be beaten by the other unit on a different feature. For in-

stance, with screen printouts Super Snapshot will print EVERYTHING! Sprites and all, and in colour if you have a colour printer.

The Expert shines in the ML Monitor with its bi-directional scrolling so I guess those are the kind of things you'll have to consider for yourself when deciding which one to buy. As I said at the outset, each unit is upgradable and it seems to be a constant "battle" on the part of the programmers to get more and better features onto their cartridge updates.

The Expert came out with V4.1R some time in mid '89 whilst Super Snapshot's V4.0 was released a little while earlier. I don't know what The Expert programmers have up their sleeve for future updates (although in the V4.1R manual they ask users to write in with "wish lists", which is nice).

I do have a little "sneak preview" of some of the things that Super Snapshot users have given as their "wish lists", either by mail or via the BBS number, that they'd like to see on V5.0 of their favorite cartridge. This is apparently still quite a little time away, but could include: REU support for file, disk, and nibble copiers; sequential file reader; character set editor; sound sample monitor; terminal program with 300 to 9600 baud support (and 80 columns for C-128); new Games Master feature with joystick port swap, autofire, infinite life generator etc; enhancements for Screen Copy (with more formats supported); save/load picture to/from disk; and more...

I can't say when the Super Snapshot V5 upgrade is to be released. If this one is to be your choice you'd be justified in getting V4 now and updating when V5 comes along. It's really not worth holding out for when the upgrade chip is so easily fitted and you'd be able to enjoy V4's features in the meantime.

As to The Expert's upgrading, all you have to do with that unit is to load in a different disk! That's all there is to it as all of the operating systems are loaded in from software as I said earlier. The most

revolutionary thing about Expert V4.1R is that the user may now swap between menu functions without switching off and starting over, as was the case with previous versions. That's a major advance and one that's been welcomed by Expert users everywhere.

It's a difficult decision to make, due to so many excellent features in each cartridge, but I'd have to plump for Super Snapshot as my own personal favorite. I find the features so easy to use and, as I got the optional switched version, I can leave the cartridge in place in the C-128D permanently.

I'd be interested to hear a Machine Code programmer's comparison of the two ML Monitors though. Perhaps we can persuade one of our readers to put pen to paper on that one for a future issue? Anyone interested should contact the Editor forthwith (or pascalwith whichever comes sooner). ❏

The way of the 128

by Eric Holroyd

W HEN COMMODORE announced the release of the C128 I was one of the first in line for one. I bought the C128D and apart from a few problems with some of the fast loading routines built into specific C64 games disks, I've never had any major hassles with it at all. I added a second 1571 drive for use as a data drive and a Star NX-10 printer.

All this has proved to be a most successful outfit which compares very favourably price-wise with the IBM clones and which will do all I ever ask of it (and a lot more besides). The concept of a multi-purpose computer appealed to me, and for those who don't know, the C128 has three distinct modes: C64, C128, and CP/M.

Firstly, having a complete C64 built in meant that my extensive 64 software library could still be used. Then the exciting new Basic 7.0 language in C128 mode offered so much by way of new (and simpler) programming commands for Graphics and Music as well as easier ways to manipulate Sprites etc.

What had taken a whole page of code on the C64 could now be done in two or three lines. I'm not a programmer myself but I've had a lot of fun playing around with program code and tips from US magazines such as *Run, Commodore MicroComputers*, and *Ahoy*. One of these published a routine to draw a Mickey Mouse head and then colour it in. Analyzing that very short program (only a few lines!) after watching it do its stuff was very interesting. It was mostly done with a series of Circle commands and was extremely effective.

The C128's third mode is CP/M, which is an acronym for Control Program for Microcomputers. This was a popular operating system or "native language" of computers before MS-DOS became so popular. There are literally thousands of Public Domain CP/M programs available which will run under this system on the C128. To use CP/M on the C128 you need to "load in" the operating system from disk in the same way that some IBM machines need you to "put in the DOS" or Amiga users load WorkBench. When that disk has loaded

you're ready to use the many games, business and educational programs which can be obtained from various PD suppliers advertised in the popular magazines.

I must confess that I never really got into the CP/M mode much, although I did play around with *WordStar* a little before I got into word processors written specifically for the C128. I found it to be quite heavy going (I'd previously been using *Easy Script* on the C64) and didn't find its screen layout all that easy to work with. If I were to go back to it now I'd probably find it easier as I've learned a lot more in the last couple of years by playing around on other machines and programs. Maybe it was just my own inexperience that caused me to think that CP/M and *WordStar* weren't all that user friendly.

Anyway, there are many C128 owners who do use the CP/M system and we'd like to hear from some of them here at *Australian Commodore and Amiga Review*.

"..over a million C128's sold"

● With over a million C128s sold there is a good market for quality software for it, although we still hear some people whingeing that "there's not much for the C128". True there isn't much in the games segment in 128 mode apart from things like *Rocky Horror Show, Kikstart, Thai Boxing*, and just a few more, but there's a really great range of "productivity software" in the Graphics and Business areas.

Berkeley Software's excellent *GEOS* system has been available for C128 for a long time now and is a completely self contained operating system with many programs that run under it. There are *GEOS* application programs covering art, word processing, database and desktop publishing applications. They're mostly interactive with each other. Indeed, many people use their C128 wholely and solely with *GEOS* and don't worry too much about its other features.

Screen from Spectrum 128 graphics program

Although I have an Amiga A1000 and a fair bit of software for it I still prefer to use the C128D for my writing and data storage. For the latter I use *Superbase* and have yet to find anything that even comes close to it for power and depth. It's programmable via its own language (like an extension of BASIC) and can be made to do very complicated tasks with datafiles whilst you go and have dinner or something.

I've used it for a long time to catalogue magazine articles of interest and if I want to get a printed list of articles on "Using Function Keys" for example I can get *Superbase* to compile a list of such articles, along with the author's name and the relevant magazine issue, then print it all out for me and ALL completely unattended. Brilliant.

It's also fully compatible with the *SuperScript* word processor and both may be in the C128's memory at the same time to allow transfer and manipulation of data between them.

For my own writing chores I use one of my three favorite word processors: *Fontmaster*, *Fleet System* and the *Write Stuff*. The first one is probably my all-time favourite. It has a good spell checker, and it also lets me do some pretty fancy stuff on the C128 by way of using nine different fonts (from a choice of around fifty on the program disk), in three heights, all can be expanded and/or italicized, and graphics may be inserted anywhere in the text.

Fontmaster's program disk includes: a converter program to use *Print Shop* graphics and HiRes pictures (such as those produced with *Doodle!*) within *Fontmaster* itself; a text translator to let you use files from other word processors; and functions to create your own Fonts and Character Sets.

I've done a "dummy" printout here to show some of the things that the C128 is capable of when using a program such as *Fontmaster*.

The other two word processors I mentioned above are very easy to use and have their own special features too. Taking it for granted that all three have Headers, Footers, Superscripts, Subscripts, Search & Replace, Cut & Paste, and all the nice refinements a writer likes to have at the fingertips, each one has little extras that prompt me to use that one when I want to do a specific task.

The Write Stuff has an "Outliner" for example, which is used to jot down ideas

for stories, speeches etc. Topics, subheadings, sub-sub-headings etc let you work on each section of the thing you're working on and then put it all together in the word processor to print it out. It's very good.

Fleet System has both a Spell Checker and a Thesaurus, both of which are fast in operation. If I want to find an alternative to a word I've already used several times in an article I can call up a list of such words in the Thesaurus, find the word I want, then have the program exchange it for the word in the specific bit of text. It'll also give me Synonyms ("like" words) or Antonyms ("opposite" words) and is a great help. The only thing I can't do with Fleet System is to print "proportionally".

Fortunately, many printers now have a "proportional" feature which will do this for me so it's not a problem. Most of the Star printers have this feature and I've always found it to be a great advantage in presenting a business letter properly to be able to use proportional print. It doesn't look as if it was "printed by a computer" then if you know what I mean.

There are many other fine C128 programs available through a variety of distributors, ComputerMate Products and Briwall are two that spring readily to mind, and it's worth checking out all the new things that are now available for C128 in the areas of desktop publishing and graphics in general.
Superbase 128

A step forward in graphics

● Talking about graphics, the effects now possible in 80 columns with Basic 8 have to be seen to be believed! It's unfortunate that C128 owners don't seem to be getting much support in the peripherals area from Commodore Australia. We haven't been able to buy a new 1571 drive for over two years now as there just hasn't been any of these fine drives imported.

A great pity, as it's fully compatible with the C64 too. Then again, we've never even had the opportunity to buy a 1581 drive to take advantage of it's greater storage capacity and increased speed. It uses the sturdier 3.5" disk too (like the

THIS IS A FONTMAS̲t̲e̲r̲ ̲DEMONSTRATION

Then we can all go along and help celebrate.

Fontmaster 128
Printout from BASIC 8

Timeworks Swiftcalc

Amiga) which is a much better idea all round. Some owners have imported them direct from the USA and report good results.

The other thing that lots of C128 owners have on their "wish list" is the Ram Expansion Unit (REU). I'm not sure if Commodore did make these available for a while, but no-one seems to be able to find one available to purchase anywhere. All this is sad really, as the C128 is a fine machine and much of the software I've already mentioned has been written with 1581 and REU capabilities built in. A C128 thus fitted up would be a great machine for a small business. It would have the capability to database customer lists; print letters, mailing labels, posters and fliers; design house and office layouts via readily available CAD software; and perform most of the mundane business chores with little fuss. The big plus with the C128 in this situation is that it also has a huge amount of games and leisure software for when the day's work is done.

I realise that the Amiga is the computer currently getting the "big push" from Commodore's advertising department, and I also know enough about business to realise that fast moving items help the cash flow. Nevertheless, I think that REUs and drives for C128 would sell here (try ringing for a 1571 drive second hand in the Trading Post to see how fast they sell!).

In any event, buyers of a particular computer are surely entitled to a modicum of continuing support? All of this is discussed by one Joe Griffin in an article entitled "Vapourware" in the September '89 issue of the UK magazine *Commodore Computing International*. This is an article about Commodore products advertised or "press-released" over the years which never materialized and have thus became "Vapourware". One interesting point that

Joe raises is the rumour of "a third edition of the C128D together with a matching C64D, both having a built-in 1581 drive". Wouldn't that be nice?

Talking about rumours: The excellent *INFO* magazine has an interview with Loren Lovhaug in their May/June '89 issue. This guy is the publisher of *Twin Cities 128*, which is the only magazine devoted entirely to the C128. At the head of the interview there's a disclaimer to the effect that the views expressed are Mr Lovhaug's and do not necessarily reflect those of the publisher. (I suppose that applies to this little lot too!)

Anyhow, this was a very interesting interview as Loren is a dedicated C128 user who keeps his ear very close to the ground for news of his favorite computer. He spends a lot of time on the phone to Commodore Business Machines and seems to think that the C128 is "not in their current build plan". He feels that it's "very likely that no more C128s will ever be made". His magazine, *Twin Cities 128*, will continue to be produced whether or not CBM discontinues production of the machine "because it's supported by subscribers, not advertisers".

He's currently trying to get CBM to appoint someone (and he's nominated for the job) to provide after-market support for the C128 with him doing the necessary liaison with CBM USA on behalf of C128 owners everywhere. He also wants CBM to license the rights to make peripherals to third party manufacturers so that users will still be able to buy the hardware that CBM no longer wants to handle. He also makes the point that CBM should try and generate a little goodwill with owners of previously marketed computers if they want them to eventually upgrade to a machine carrying the same brand name.

Good point, and he further suggests that owners write to CBM telling them

they need more support and that they'd be more likely to buy another CBM product if such support was forthcoming. All in all, this is a very good interview with lots of interest for C128 owners. The magazine seems to be well worth subscribing to, being specifically dedicated to the C128, and I'm going to investigate that for my own use.

You'll probably gather from all this that it'll be a long time before I get rid of my C128. It's much too useful a machine and I'm looking forward to using it for a long time to come. I suspect that a lot of other satisfied owners will feel exactly the same too. ❑

Would you rather keep pace?

Or keep ahead.

The reviews of the Amiga 2000 have been overwhelming in their praise.

Rightly so.

Its major features are tailored to keep you a jump ahead of the business pack.

The premier feature is undoubtedly multitasking. This lets you run virtually unlimited programs simultaneously.

Documents, presentations and the like are quicker to prepare and more impressive in their appearance.

Full colour graphics – 4096 colour shades – boost your impact, on screen and on paper.

Amiga's internal expansion ability shows all concerned that you make sensible investments.

Future additions are accommodated within the system easily and economically. More power and greater capability.

Should you need to be MS-DOS compatible, perhaps for working at home, Amiga is capable of running both

Operating Systems. A very simple expansion.

65,000 Amigas have been sold in Australia. 850,000 Amigas worldwide.

Accordingly, the software collection for Amiga is as diverse as it is numerous.

Titles like WordPerfect, Professional Page, MaxiPlan, KindWords and Superbase.

A strong business and graphics package for building a stronger business. More are being added.

This is a computer with a career.

Having read this far, you're obviously interested in keeping ahead.

So, as an introduction to Amiga's possibilities, your Commodore dealer will give you the software you need to begin powering ahead.

Smart business people are guiding their future with Amiga.

AMIGA 2000 from Commodore

Sherlock Super Creditors C128ers get down to business

W HEN COMMODORE released C128/C128D in 1985 it was an instant success. Many C64 users were ready to upgrade their computer systems, without having to dispose of all their C64 software. These new C128 machines were twice as fast as the trusty old 64's and boasted a double capacity disk drive and an 80 column output as well as the ability to run the majority of C64 software. If you had access to CP/M software titles you could run that as well.

Unfortunately software designed to utilise many of the enhanced features of the 128 mode did not eventuate until more recent times. You now have a choice of many wordprocessors, databases, and spreadsheets.

You only have to look at the entire *Pocketfile* series for the 128 to appreciate to power this machine can generate with good programing. Unfortunately the small business accounting or home accounting field was sadly lacking in good quality, if any software. This is about to change!

In the March edition of *Australian Commodore and Amiga Review* last year we reviewed an all Australian product called *Sherlock Super Debtors*. This package has been very well received. The follow up products, *Sherlock Super Creditors* and *Sherlock Super Ledger*, are currently being released onto the Australian market.

C128 features supported!

● *Super Creditors* is not a C64 program modified to run on the C128 machines, but is a package designed from the bottom up to take advantage of all the features the 128 has to offer.

One of the most unique features is the way the program takes advantage of the additional video ram in the machine. The programmer has placed a Diary function and a Pop-up Calculator in this unused part of memory. At any point in the pro-

> **❝ A package designed from the bottom up to take advantage of all the features the 128 has to offer. ❞**

gram simply press the help key or linefeed key and instantly these functions will appear. The calculator is easy to use and if you press the wrong key sequence, an audible tone will sound, whilst the correct key presses make a 'digital' type sound. I really appreciated this excellent feature because I can never lay my hands on my calculator when I need it. This feature is in all of the Sherlock small business packages.

Sherlock Super Creditors can also take advantage of expansion memory if fitted. The C128 can be expanded by 128K, 256K or 512K increments. That is by using either the 1700, 1764 or 1750 RAM cartridges. If any one of these cartridges is present when the *Creditors* program is 'autobooted', the program will detect its existence and load both parts of the *Creditors* into memory. This function is totally automatic, and is commonly known as 'AUTO CONFIGURATION'. If RAM is not available the main program will load and begin execution.

Most day to day functions are contained in the *Creditors* main program. End of month functions and some reports are in the reports program. Having the second program in RAM reduces the usual load of 9 seconds to one fiftieth of a second.

The use of RAM will allow other programs in the Sherlock Super series of small business programs to 'co-exist' in external memory. That's right, a type of multitasking, so to speak. You can load the *Creditors* programs into memory and then load *Sherlock Super Ledger* also into memory by selecting the General Ledger

option from the main menu. Once loaded you can remove your General Ledger program disk and remove the *Creditors* program disk and all the software is RAM resident. Switching between programs in memory is totally transparent to the operator.

Fast! Copier

● The writers of the Super Creditors have also placed on the Creditors disk a RAM copier. Depending on which RAM expansion device is used, a C128 double sided disk can be copied in either one or two passes, by copying the entire disk into external RAM and then placing on your backup disk a 100% copy of the original using both burst read and write commands. (See listing at the back of this annual!)

Getting started

● A Creditors program in simplistic terms is a program that will record invoice/credit note and payments details against your creditors, in other words people you OWE payments to. The Debtors program records invoice/credit notes and payments received from debtors - they are the people who OWE you payment. And the General Ledger compounds the totals from all ledgers, debtors, creditors, sales system etc, together with less frequent items such as sales or purchases of assets, general overheads etc. This combination will produce a profit and loss statement, which together with assets, liabilities and capital items also stored, gives a balance sheet.

Super Creditors is aimed at the home business person, or indeed any company that wishes to keep track of their purchases from their suppliers. It is all too easy to believe the goods you sent back were actually credited to your account - or were they? If you have a C128/C128D and your reply was 'they wouldn't do that to me', then read on - you may need this program. Simply 'post' (enter) the invoices/credit receipts as they are received from your supplier and when you make a manual payment, post that payment as well.

Your Creditors account totals should be the same as the statement totals issued from your supplier. The design of *Super Creditors* is to make life as simple as possible at the end of each trading period by having the program select invoices from suppliers for payment. The program has built into it a Payment menu system which allows the operator to view and alter individual invoices for payment. Options allow the 'flagging' of invoices greater than a chronological date and allow the operator to choose the starting and ending creditors to be selected for payment.

A report will be supplied detailing which invoices and for how much. If this exceeds your budget you can withhold payments on all or some payments. Once this selection process has been completed you can instruct the program to make 'PAYMENTS'. You then select payments and supply a starting cheque number and the posting of the payments will be done for you automatically. If you are using the *Super Ledger* program you are required to supply the bank account number to draw these cheques against.

This process will automatically post cash payments, mark the invoices as paid and return the balance on these invoices to zero on each individual invoice, simultaneously marking by way of an asterisk on the remittance advice which invoices are being paid by this enclosed cheque. You will also have a printed report with the cheque number you sent and the individual invoices that have been paid with this cheque. You then have a hard copy for your records of who was paid, for how much and which invoices paid.

Super Creditors can keep details on 500 creditors on one disk and up to 492 details (invoices/credits/payments) per used creditor. The program is exceptionally fast due to the custom BLOCK READ & WRITE routines used throughout the program. This gives overall speed as the program knows in advance where the data is without having to rely on the Commodore DOS to find it.

Reporting facilities

● The strength of this package is its reporting or enquiry facilities. These reports can be directed to Screen or Printer. Some of the printed reports are Analysed Trial Balance (90/60/30/current) - Remittance Advice Or (inquiry) - Customer Listings - (numeric or alphabetic) - Month End and Year End Purge Reports - Creditors Letter Writer - Print 'flagged' Payment Report - Generate Cash Payment Report - audit trails for Invoices, Credit Adjustments And Cash Payments.

Super Creditors like *Super Debtors* is fully integratable with the *Super Ledger* program. What this means to you the operator is true data transfer between programs. Simply do your normal postings of invoice/credits/payments into the Creditors and if you have the Super Ledger active all this information will automatically be carried through to the general ledger posted to the Purchases Journal and your banl balances will be adjusted as well.

Simply remove the Creditors disk when instructed and insert a General ledger data disk, and the 'updating' of te General Ledger will occur automatically and an audit trail will also be produced. The remittance advices are the same as the statements in the Super Debtors (REDIFORM R103/HAR). For further information call (043) 244929. RRP $149.00 plus $8.50 postage and packing.

Phil McGuinness, the General Manager of Sherlock & Watson, tells me that both *Super Debtors* (v1.2) and *Super Creditors* (v1.2) are ready for shipment at $149 each plus $8.50 postage.

Mail orders should contain the company name for encryption on the master disks with their payment.

To purchasers of the entire package consisting of Debtors, Creditors and General Ledger in a single purchase, a SPECIAL price of $299.00 including delivery will apply.

● Any (single) package $149.00 + $8.50 postage/handling.

● Any (two) packages $230.00 + $8.50 postage/handling.

● All (three) packages $299.00 (includes postage & handling)

A Hitch-Hiker's Guide to
Communications

by Bernard de Broglio

Computers are to be found dotted all over the globe. By linking your computer to the local telephone exchange, you too can venture forth onto this electronic network. Pack your bags - it's time to travel.

YOUR FIRST REQUIREMENT is that piece of hardware known as a "modem", a smallish box which allows the computer to make sense of the telephone system. When your computer shoots information down the line, the modem must first MOdulate it into a form the telephone can comprehend. At the other end of the line, the high-pitched squeal is DEModulated.

The "mo-dem" converts a digital signal to analog and back again. Installing a modem is not complicated. A slightly non-standard RS232 cable links the unit to the C64 or 128, and it may draw power from the computer or have its own power supply. A cable connects the modem to a standard telephone socket. Although the principle remains unchanged, there is a great variety in the modems for sale. These revolve principally around the speed at which the unit communicates.

A modem's pace is calculated by the number of "bits per second" (bps) it can pump down the telephone line. This is also known, somewhat loosely, as the baud rate. This year, 2400 bps is the go. Computer users have speed as their holy grail, and most are holding out for, or already have, modems that can handle 9600 bps. At the moment, these turbo models are very expensive, but expect to see them as standard equipment within a couple of years.

For now, 2400 bps modems are available at a reasonable price. Your need for speed will depend very much on your individual requirements. If you frequently dial overseas systems, the additional cost of a 9600 modem would be justified by the savings on IDD charges. At the moment, few Australian systems support this baud rate.

Just to muddy the waters, there are two standards at work in the modem world for units at 300 and 1200 bps.

These are "CCITT" (which is recognised world-wide) and "Bell" (applicable only to the United States). If you purchase a modem at 300 or 1200 bps, keep this in mind. There are no such differences amongst modems at 2400 bps and over.

A fellow traveller

● An Australian-made modem is your best buy. Not only are you giving the local economy a boost, but you'll find yourself with a warranty and a company that knows what it is talking about. If you run into problems, this support will prove invaluable.

Second-hand units at 300 and 1200 baud are often advertised for sale. Think carefully of the restrictions of such baud rates and enquire most diligently about compatibility with your computer. You may regret the cheaper modem when it doesn't respect your software in the morning. Organise a test-run if possible.

As with much computer hardware, newer is better. Netcomm have an extensive range, which includes the popular Pocket Modem. Avtek Data Communications have the MegaModems in several different configurations.

The Maestro 2400 ZXR and XR

● Maestro produces modems of Australian design and manufacture. More importantly, its product is first class. The 2400 ZXR modem has the lot for about $399. It will handle 300, 1200/75, 1200 and 2400 baud, with auto-answer and auto-dial. It is compatible with the industry standard Hayes "AT" command set, but if this means nothing to you, don''t worry. This standard will ensure that you never have to learn about it. The Maestro handles both tone and pulse dialling.

For around $100 less, the Maestro 2400 XR is the same basic unit, but supporting only 1200 and 2400 baud. Remember, Viatel requires 1200/75. If you never intend to use Viatel, this is not a problem.
VIP-XL File management page

Both modems are a breeze to set-up. They are sturdy and reliable, and are backed up by a ninety days warranty. Coloured basic black, the modems are roughly the size of a large hardback novel. My only criticism lies with the manual. It is not particularly helpful for the new user.

Maestro Pty Ltd may be reached at Calool Street, South Kincumber NSW 2256. The Maestro ZXR and XR are highly recommended.

Terminal software - into the driver"s seat

● Commodore 64 users will find there are many more terminal programs floating around than are commercially available. *VIP-XL* is one such example - an excellent program. Icon interface or function keys allow selection of many options. The environment may be saved, there's a phone book, capture buffer but only one transfer protocol - XMODEM. Text files may be directly transmitted too, although this is a little risky. As a terminal program, it looks and feels good and is powerful enough for most casual users.

For the power user *Kermit* may be a better solution - once again, only available these days through user groups. This is a semi-shareware type program.

For off-the-shelf purchases GP-Software sell an excellent program which is bundled with some Netcomm modems. Ask your local dealer for the latest information. Once again, only Xmodem is handled, there's a phone book and plenty of hot keys easy to use menus. Smart design and very well documented. *GP-Term 64* is available from from most Commodore dealers for around $59.

For those on a budget, our own disk magazine, *Suite 64*, has published several terminal programs over the years. See the list in this publication for details, pages 66, 67.

Have modem, will travel

● The modem is plugged in, the software is talking to the hardware and all LED's are glowing in anticipation. What now?

Your first call will probably be to a local system known as a "Bulletin Board". A Bulletin Board is simply another computer linked to a telephone line, equipped with the appropriate software. It will allow you to leave and receive messages and to upload and download software. Think of it, perhaps, as the local pub - all

VIP-XL System options

through the day and night, people will call in to the Bulletin Board System (BBS), writing and replying to messages, discussing everything from Abba to Zulu rituals and back. Fortunately, your local BBS is not restricted by licensing laws ...

And how do you get into the BBS? Simply dial its phone number. (The newer "smart" modems will ring the number for you, when you double-click on the BBS listing in your "phone directory". This is called auto-dial and it is infinitely preferable. Older modems may require you to dial the number manually.) The BBS will answer your call and emit a high-pitched squeal. This is the "carrier", the signal which transmits the information to and from the BBS. The modem will make sense of this and after a brief pause, will display the system's log-on message. Hopefully.

If there's garbage on your monitor, make sure that your terminal and the BBS are communicating at the same baud rate, and that the following are set correctly: most Bulletin Boards work on 8 Data Bits, No Parity and 1 Stop Bit. You could even read the manual.

The Bulletin Board will now want to know who has called. You will be asked to input your name or user identification number. If you have called before, a password may also be required. New users are generally asked to fill in a questionnaire, giving their name and address, and must choose a password. The System Operator(s) will treat this information as confidential, but discretion may be in order. Both users and SysOps must be protected from each other! (A

word of warning. Treat your password as you would your bank PIN number. Give it to no-one and change it regularly.)

Your access to a Bulletin Board will vary from place to place. On some, there is a membership fee to pay. On others, there are certain areas restricted for regular users or specific clubs. Of course, Telecom will also charge you for the cost of your call. In almost every case, the BBS will be run by a private individual or two, at their own expense. Membership fees may help to defray the cost of equipment, but very few systems operate at a profit. Your generosity will be appreciated.
That is not to say, however, that Bulletin Boards are amateurish affairs. On the contrary, many are of exceptional quality.

The Australian Bulletin Board Registry compiles regular lists of these on-line systems. According to the latest listing, there are some 363 Bulletin Boards in Australia alone. (Full list on page 85.)

Exploring the BBS network will be your first task! But what exactly does a Bulletin Board offer? Let"s take a ride through Sydney's "TeleInfo Systems Australia" BBS.

TeleInfo Systems Australia

● TeleInfo is a six line Bulletin Board based in Sydney. It provides a wealth of message areas and public domain software, and an interesting concept known as "Chat". The local message areas of this BBS include a Discussion and Media Watch section, complemented by SIG's
GP Term – auto dial menu

(Special Interest Groups) for Amiga and Apple users. There are also a number of "Echomail" conferences. The notion of Echomail will be introduced shortly, but suffice it to say that this BBS offers a number of national conferences, such as the Australian Trading Post, Science, Games and Commodore Echoes. International conferences include the Amiga, Space, CD-ROM, Audio, C, Humor and Shortwave Radio Echoes.

You will get to know the terms "uploading" and "downloading" well. Most Bulletin Boards have a files section, from which a program may be transferred - over the telephone line - to your computer. This is downloading. Most Bulletin Boards also like you to submit programs for the file section and the benefit of other users. When you transfer a file to a BBS, you are uploading.

An alternative to messaging other users is "Chat", a real-time conversation between any or all of the callers logged-on to a Board. On TeleInfo, the "Chat" area is called the "CB Simulator". In this conference, what you type is sent to each other person in the CB Simulator, preceded by your name and line number. What follows is similar to normal conversation, but not quite. If the BBS is akin to a pub, then the CB Simulator is the bar. Discussion can be lively and the puns grotesque! "Chat" is a relatively recent innovation and should be experienced.

TeleInfo Systems Australia is a big BBS with plenty of activity. The six lines are appreciated, but it remains busy in the evenings. A membership fee of $25 a year gives full access to the system and a more generous time limit. Visitors have

30 minutes per call and 60 minutes per day on the Board, with no access to the files section. TeleInfo supports all baud rates up to 2400. Call TISA on (02) 975-1099.

Treading the boards

● Prophet TBBS is primarily an IBM oriented Bulletin Board, but it has a great cross-section of message areas. Prophet, like TeleInfo, has a "Chat" facility, called Yakety-Yak. Multi-line systems are becoming a little more frequent now. Prophet was one of the first. It has 6 lines and a 30 minute call limit, ensuring a brisk traffic throughout the day. Prophet BBS may be reached on (02) 628-5222. "As far as privately operated, free-access systems go," says Andrew Farrell, "this is one of the best".

Paragon is another Sydney BBS, recommended primarily for the quality of its message base. The local discussion is always lively and the users make an effort to post creative messages. Paragon charges no membership fee. It may be reached on (02) 597-7477. But any opinion of individual systems is going to be subjective. What is certain is that you will find a BBS that serves your interests.

A jaunt in the country

● Australia's national videotex service is Viatel. It is this system that will provide you with telebanking, telebroking, teleshopping and on-line TAB details. This sounds like everything you might need, but there are two drawbacks to consider.

The first is that Viatel is not cheap. A

monthly subscription for a non-business user is $3.50. You will, of course, pay the cost of a local call for each log-on, as well as a time charge. Viatel costs 9 cents a minute during peak hours. At other times, expect to pay 6 cents a minute. You may also have to accept a frame charge for some areas. The frame charge can be anything up to $4.99.

The second complaint is subjective. While the concept of electronic news digests, information databases and travel information sounds good, there isn't all that much purpose. A copy of the daily newspaper, for example, is cheaper, more informative and easily portable. However, telebanking - shunting money around your bank accounts - is popular and many people have sworn by telebroking.

For further information on Viatel, write to Freepost 20, Viatel, G.P.O. Box 188C, Melbourne Victoria 3001.

The world - on 21c a day

● Hopefully, you've enjoyed these escapades, but your horizons have been broadened. It's time to go beyond these shores. Let's see how Australia fits into the world-wide scene.

Connecting Bulletin Board Systems all over the globe is FidoNet, the very first international BBS Network. FidoNet had its beginnings in May 1984. Two American programmers, Tom Jennings and John Madill, were coding a Fido BBS system, and thought it might be helpful if two Bulletin Boards could contact each other without any human interference, preferably in the early hours of the morning when the System Operators (SysOps) were asleep and few users were calling in. By February 1985, the Fido network consisted of 160 systems. Today, a greater part of the world is linked to FidoNet. An Australian - Matt Whelan - is the International Co-ordinator.

To give you an idea of the breadth of this network, consider how FidoNet is organised: There are four main geographical Zones - North America, Europe, Oceania and South America - which are divided further into Nets. Each Net consists of a number of individual Bulletin Boards, called Nodes. Each BBS in the FidoNet system thus has an "address". Take for example "Paragon" BBS which has a FidoNet address of 3:712/502. The first digit stands for the Zone. Oceania is Zone 3. The following three numbers specify the Net within the Oceania Zone. Net 712 has been allocated as "Sydney Net". The

final three digits specify the exact BBS within the "Sydney Net" area. Node 502 is "Paragon" BBS. Where a BBS is not linked to a network, the non-existent Net number is replaced by a two digit Region number.

A Node may also be accessed by Points. A Point is usually an individual system, almost a one person BBS. If you become addicted to FidoNet messaging, this may be an option. Your computer will be set-up to dial the "Server" Node at the usual ungodly time, and to transmit and receive parcels of mail. This can then be looked over at your leisure. Points are becoming more popular, but are not yet a viable option for most BBSers. Someone "pointing" from "Paragon" BBS might have an address of 3:712/502.1.

Throughout this spider's web of Bulletin Boards, messages are being distributed along every strand. Messages may range from a brief greeting to a lengthy discourse on the merits of mushroom farming, but they are similarly treated. Keep in mind, though, that this service is freely offered by publicly-minded SysOps! In the early hours of the morning, the day's messages on a system are parceled together and compressed. Hundreds of Bulletin Boards around the world toss their packets of mail from Zone to Zone.

Gareth Powell, editor of the *Sydney Morning Heralds* computer section, calls this "one of the most amazing non-commercial computer systems in the world". From a Node or single BBS, your message travels to the Network Coordinator of your area. The Network Coordinator will automatically route the public message to all the Nodes in its net and the private mail directly to the Node for which it is intended. People will receive your letter within a day or two. Simple!

But it is high time to distinguish between two types of mail: netmail and echomail.

Netmail is intended for private communication only. SysOps prefer that general conversation be left in public message areas, to stimulate conversation, but if it's Top Secret, send it Netmail. Only the SysOp will be able to read it and a SysOp's discretion is legendary. Like any other letter, don't forget to include the correct FidoNet address.

Echomail is what Bulletin Boards are all about. Imagine message areas set aside for particular topics, accessable by thousands of computer users on the Fido network. How does this work? A group

of Bulletin Board Systems will decide upon a "conference" with a given theme. This does not always have to do with computers. Each Bulletin Board in the group will have a message base set aside for this particular topic. Every message posted on one board is then echoed to every other BBS that is part of the conference.

Consider, if you will, the International Amiga Echo. You can post a message in this area on a Bulletin Board System in Perth. Within days, it will find its way to every other BBS that supports the conference. Your query might find its reply in California. Log-on to your local Bulletin Board and collect your international mail - for the cost of a normal call.

Echomail provides an immense information base on subjects ranging from Recipes to Shortwave Radio. Not only is it educational, but it can also be fun. The Canada-Australia Echo is one example. This has been set up specifically to provide contact between people in these two countries. Scandinavia has also tapped into the conference. Look to this Echo for friendly international chat.

The Space Echo is patronised by NASA personnel and space enthusiasts alike. The content is occasionally specialised, but rarely dull. From NASA headquarters in Washington comes daily bulletins and news releases, with details of shuttle launches and other missions. Keep an eye on American and Soviet space agencies and enjoy the immediacy of international communications!

In the United States, there are some 50 Bulletin Boards that support self-help groups such as Alcoholics Anonymous. Callers have access to an on-line collection of A.A. "recovery advice" and their own message base. The anonymity of a Bulletin Board is helpful for people who may be reticent about attending a meeting. The act of writing the message may itself be a cathartic experience, and the response is likely to be encouraging and understanding. Such message bases are a vital link for people in rural communities.

The etiquette of protocols

● We have been working under the assumption that telephone lines are a wondrous thing. Not yet, anyway. Mysterious crackles are evident in normal phone conversations and these do not disappear when the computer does its stuff. "Line noise" is a burden that the BBSer must bear.

Things are getting better though. The lines may not have improved substantially, but the error checking protocols certainly have.

Very smart programmers have developed a means of minimising garbled communications. You will come to know these protocols as well as your family, but there is no need to understand them. Basically, the protocols will check each small segment of data received and sent against a Cyclic Redundancy Check (CRC) character. Any variation in the CRC patterns at either end will cause the last block of data to be transmitted again; that is, a Negative Acknowledge (NAK) is transmitted to the sender.

If all goes well, the sender receives an Acknowledge (ACK) and continues pumping out the data. Common protocols include Xmodem, WXmodem, Ymodem and Zmodem. Xmodem is good, Ymodem and Zmodem are preferable. As long as your terminal and the Bulletin Board are using the same protocol, there is no need to bother with the arcane mathematics. If you are interested in a closer look at error-checking protocols, there are lengthy text-files on the subject in the files area of many Bulletin Boards. Good luck.

Prepared for toke-off

● There is one component of the electronic world that has not been adequately discussed. In fact, it justifies the very existence of the communication network. That component is real people. They say travel broadens the mind. Get to it!

"FidoNet" and "Fido" are registered trademarks of Tom Jennings. ❑
GP Term C64 - Screen preferences

Communication Glossary

Acoustic Coupler: A device that allows modem-generated audio signals to be transmitted into and received from a telephone handset. The handset is placed into rubber cups on top of the coupler. A small transducer at the bottom of the cups produces the actual signal. Rarely if ever used except by portable computers and car faxes.

ACK: Acknowledge. Yes, I received that last byte, or string of bytes. Normally only used in file uploading or downloading.

ANSI: A terminal protocol.

ASCII: American Standard Code for Information Interchange. A seven-bit code used widely in data communications to transmit the letters of the alphabet, plus the standard punctuation marks and certain control characters. Every character has a corresponding numeric value that is common on most home computers. This allows different types of machines to speak with each other.

Auto-answer Modem: A modem that can answer an incoming call by generating a carrier tone that signals the originating modem its call has been received.

Auto-dial Modem: A modem that can simulate a telephone dialer using either pulse or touch-tone dialing signals.

Austpac: Packet switching network provided by Telecom. Allows computers who talk at different speeds and languages to exchange information.

Baud: A speed expressed in bits per second transferred over a communications line. 300 baud is roughly 30 characters per second.

Bell: The American standard for data communications.

Binary: A number system using base two rather than base ten as in decimal.

Bit: Short for binary digit (either 1 or 0), the elemental unit of digital information. Every character is made up of several bits (usually eight). A bit is either one or zero, corresponding to pulses that may be transmitted audibly on telephone lines.

Buffer: Often called capture buffer. In general, a temporary storage place for data. A capture buffer is temporary storage for data "captured" from a communications link.

Bulletin Board: A computer you can access via modem especially for leaving messages to other users. Various subject areas are available, and normally programs can also be uploaded or downloaded.

Byte: On an eight bit computer, eight bits make up a byte. Usually one byte is equivalent to a character. Each character in the ASCII set can be represented by only seven bits. Thus, a byte can be thought of as equivalent to a character for approximation purposes only.

Carrier: A steady signal that can be changed in tone (modulated) to transmit data.

Checksum: The last thing you do on your tax return. Also used as a test for the integrity of information transmitted by any means where corruption may take place.

Control Characters: ASCII characters that do not print out, but are used to control communications. Control characters can, for example, signal a sender to stop transmitting information when the receiver is busy.

Data: Information in code, text or numerical form, generally represented in ASCII code for digital communications.

Database: A file or program which contains information in a specially formatted way. Normally made up of records and fields which are roughly equivalent to a card file system.

Download: Transfer a file from another computer to your computer.

Duplex: Twin accommodation. Refers to the two-way nature of modem communications. In full-duplex communication, both terminals can send and receive simultaneously. In half-duplex operation, both ends can send and receive, but not at the same time. With full-duplex, echo-back communications, a transmitted character is not displayed until it has been verified by the receiver.

Electronic Mail: Messages directed to a specific user on a Bulletin Board system. A personal message, similar to mail.

Frequency: The number of cycles of an oscillating waveform that occur each second.

Glitch: Hiccup on the telephone line. Some information may be garbled making it unreadable.

Hayes: A widely accepted standard set of commands for controlling modems and setting various options within them.

LF: Line feed. Moves the cursor to the next line.

Modem: A device that modulates audio tones to carry digital signals and also demodulates the signals at the receiver so they can be understood by a computer.

NAK: Negative Acknowledge. Used in file uploading/downloading.

Noise: Random disturbances that degrade or disrupt data communications, present to some degree in all transmission links.

Originate/Answer Modem: A modem that can either start a telephone call or receive one automatically. Some modems automatically assume originate or answer status, others require manual switching to the proper state.

Parity: A means of checking for errors by adding an extra bit to each ASCII character transmitted.

Protocol: A set or rules for the transmission of data. Protocols describe when transmission will start and stop, what error checking system is in effect and the like. It is the format by which information is sent through the telephone system to minimise errors. Files are normally broken down into smaller parts sometimes called packets. A checksum is calculated and then compared with that calculated by the receiving system to ensure everything arrived intact.

RS-232: A standard for transmission of serial data covering both hardware configurations and transmission parameters. Different manufacturers may implement some or all of the RS-232 standard in their communications products.

SEAlink: A downloading/uploading protocol.

Serial data: Data sent one bit at a time, as opposed to parallel data sent several bits at a time. Modems operate on serial data.

Sysop: System Operator. The person who is responsible for the smooth operation of a particular remote access system such as a Bulletin Board.

Teleconferencing: Several people get together to talk via electronic means, either telephone or computer, about a particular subject. Often used in multi-user remote access systems.

Terminal: A device that receives or transmits digital information. Communications software is designed to control computer during terminal mode operation.

Upload: Transfer a file to another computer.

X-ON/X-OFF: A protocol for pausing data transmission using simple control characters. ❏

Over One Million Amiga computers have
been sold worldwide.

As an exciting component in a child's
education, Amiga is a sound investment.

Why not give your children the educational advantage?

In fact, the Amiga 500 and the Amiga 2000
are two of the most advanced educational
computers available.

Their features include the ability to expand
as far as a child's willingness to learn.

A huge software base that's constantly
growing to keep pace with the latest in technology
and knowledge.

Plus a whole range of other uses including
graphics, animation and synthesized sound.

If you're clever enough to buy an Amiga
computer, imagine the boost it will give your
child's education.

Commodore

Watch Out! Bugs

The insidious bug to end all bugs. Eric Holroyd explains.

COMMODORE HAVE always refused to acknowledge that there is a bug associated with using the SAVE "@ command. Experienced users, on the other hand, have no doubts that there is.

For newer users who may be wondering what it's all about anyway, let me explain. First of all, the correct way to Save a file (it could be a program typed in from a magazine for example) is by typing:

SAVE "filename",8 (RETURN)

What this does is create the file on disk (note that none of this applies to tape users) which obviously then takes up a certain amount of disk space. This is shown in "blocks" at the foot of a directory when listed. Commodore DOS gives us 664 blocks free on a newly formatted (sometimes called "initialised") disk. Let's say we have a program which takes up 50 blocks and it's to be saved to disk.

By the way, it's always a good idea when typing in a program to save it before running it for the first time as a typo could make the computer do all kinds of unpredictable things. Maybe it'll even crash and lose all your valuable typing! All computer users have lost hours of typing this way, before realising the value of "saving before running", so make it your regular practice.

So, on a new disk there's plenty of room to store our 50 block file. Even if 614 blocks had already been used up in storing other programs we'd still have room to store (or save) it. Now comes the crunch! If there was a typing error in the program it would need to be corrected and the program re-saved. This is where "Save and Replace" (or "Save with Replace" as it's sometimes called) comes in. Theoretically, by issuing this command along with the program name you can save the corrected version of the program and erase the version with the typing error. In other words, replace the first version with the corrected version. What's believed to be the safest way to do this is to use the command exactly as follows:

SAVE"@0:filename",8 (RETURN)

Unfortunately, the command as built into the C-64's operating system, saves the new version and then erases the old version. This wouldn't work in my example above (614 + 50 = 644 = Disk Full) as there isn't enough disk space available. There needs to be at least enough blank disk space to save a second version of your program for the command to have a chance of working properly. Again, the best and safest way to achieve all this is to first of all Scratch (or delete) the first version then save the new version. The command for scratching a file, as per the 1541 disk drive manual is:

OPEN 15,8,15,"S0:filename":CLOSE 15 (RETURN)

(The 0 in "S0:" is a zero by the way and tells the DOS, or Disk Operating System, which disk drive to work on. More about this in a little while.)

If we do this first, then save the program as per the first command above, there will be no danger of anything being corrupted. In fact, the whole job can be achieved with one command like this:

OPEN 15,8,15,"S0:lilename":CLOSE 15:SAVE "filename",8 (RETURN)

C64 users who have the Cockroach TurboRom fitted to their computers can do all of this very much more easily. This "add-on" is a great idea and has much shorter commands to do almost everything connected with the disk drive. It's command for "Save and Replace" is this:

@SAVE"@:filename (RETURN)

That's it! There's no need to type @0: to signify the drive number as the TurboRom automatically defaults to drive 0 and it knows you're using a disk drive anyway so doesn't need you to enter ",8. Also, when performing a "Save and Replace" it first of all scratches the old version and then saves the new version just as I've described for you to do manually just above. Incidentally too, when you list a disk directory to the screen to check the number of Blocks Free the Cockroach command is:

@$ (RETURN)

This gives a "harmless directory" which doesn't destroy the program in memory as does the normal Commodore DOS command of:

LOAD "$",8 (RETURN)

This wasn't intended to be a commercial for the TurboRom, but I'm so used to using it in my own C-64 that it seemed a logical thing to do to show how an "add-on" product solves the Save and Replace problem. At the same time it offers other benefits such as the directory one just discussed, as well as a huge increase in operating speed.

Another little point which may cause some confusion to new users is the use of the word "initialised". As I said earlier, this is often used instead of the word "formatted" when discussing a disk prepared for use with the command:

OPEN
15,8,15,"N0:diskname,ID":CLOSE 15
(RETURN)

@N:diskname, ID (RETURN) for
Cockroach users

Initialising seems to have two meanings in the Commodore 64 world, the one just discussed refers to preparing a disk for use. (Referred to in disk manuals as NEWing the disk - Ed.) Whilst the other use is taken to mean returning the disk drive to its start-up condition after a drive error has occurred. Sometimes the read-write head may get stuck in such a position that it can't read the information on a disk and "initialising" the drive will return the head to its normal position. To further confuse things, this is also called a "drive reset", which is the way I prefer to think about it anyway.

The command to initialise the disk drive is:

OPEN 15,8,15,"I0":CLOSE 15
(RETURN)
@I (RETURN) for Cockroach users

I mention this one because I fell foul of an American program once (before I understood the disk formatting meaning of "initialise") and finished up with a blank disk. Remember, when you see the word, think about it before you press the "Yes" button.

The bug in "Save and Replace" has been identified as being part of the original Commodore operating system which was carried over from their earlier computers with two in-built drives. Apparently, if no drive specifier (@0: or @1:) is used, the DOS gets confused and looks in a single 1541 system for the non-existent second drive.

When it doesn't find that second drive it performs a SAVE with (sometimes) disastrous results. You may finish up with a corrupted new version, a deleted old version, and a new typing job ahead of you.

I don't claim any of the kudos for discovering all this about "Save and Replace", it's just that I'd read all about it some time ago in *Compute!* magazine where Philip A. Slaymaker (the author of the excellent Peek-A-Byte utility) covered the subject over two issues. It's a good discussion running to about six pages and also has short example programs to demonstrate the existence of the bug and the effects it can have. ❑

A better way to save big programs

● For big programs under development, this built-in safety SAVE makes backup copies along the way. That way, if a new version introduces bugs that are hard to deal with, you can always go back to a previous pass.

Notice that the disk drive channel is open and closed every time avoiding a lockup if a backup version doesn't exist yet.

This routine first erases the oldest backup version of the program on the disk (if there is one) then renames the second copy to #3 - the first backup becomes #2, and the previous "new" version becomes BACKUP #1. Last, the current version in memory is saved to the disk, any time you type GOTO 10000!

```
9999  END
10000 OPEN 15,8,15,"S:BACKUP
      #3:CLOSE 15
10010 OPEN 15,8,15,"R:BACKUP
      #2,BACKUP #3: CLOSE 15
10020 OPEN 15,8,15,"R:BACKUP #1,
      BACKUP #2: CLOSE 15
10030 OPEN 5,8,15,R:PROGRAM
      NAME,BACKUP #1: CLOSE 15
10040 SAVE "PROGRAM NAME",8
```

```
GEOS HAS BEEN THE life and soul of Commodore 64 software development for some time and it looks set to remain the best option for the future. It has truly come of age now, with the release of Version 2 boasting many new features.

Apart from those added to the operation of the desktop, there is now support for two disk drives plus the Commodore RAM expander for serious GEOS power users. (We recommend the 128 RAM expander only with older model C64's - the newer version cannot cope with the power drain.) There are also more printer drivers added so buyers should have no difficulty in finding a printer driver to use with their printer.

What is GEOS all about?

● For the uninitiated, GEOS may seem like a lot of hot air. Is it all just a fancy front end? In some respects, an underpowered C64 with GEOS can seem like a case of overkill. However GEOS has ex-

cellent graphics and, the concepts are well worth learning, as they are a part of larger machines such as the Amiga.

The environment is easy to work with, and with the latest version, it's reasonably powerful. The great part about GEOS is that once you know how to use one program, learning another is fairly simple. Organising your disks and files is also much easier than the conventional arrangement. For beginners, GEOS is a mighty step forward. You can get on with actually using the wordprocessor or paint program and worry less about operating the computer. For serious use, a mouse is a must.

It's best to think of GEOS as a replacement operating system. Although GEOS makes use of some of the in-built software in ROM in the Commodore 64, much of what happens relies on GEOS own custom routines. These routines or programs are used by all the GEOS modules or add-on programs. This gives the entire environment a similar look and feel, making it easy to use.

Once you boot GEOS up, you'll find

that files, disks and programs are represented by little pictures or icons. These can be dragged around the screen, moving them to another device, or they can be run by double clicking on the relevant icon. All this is done using a pointer operated by the 1351 mouse, joystick or touch tablet. Do yourself a favour - for around $89 GEOS is well worth a look!

Improvements with version 2.0

● Version 2.0 adds many new features and options as well as including software previously sold separately - geoWrite and geoPaint. It is now possible to do multiple file operations instead of having to deal with one file at time.

For instance, if you wish to transfer say, six files from your work disk into your ram expander, it is simply a matter of holding down the Commodore key, clicking on the six files required (which then change to reverse video), then clicking on any one of the chosen files. A multi-file 'ghost' icon then appears and you click on this, drag it over to the ram expander disk icon on the right hand side of the screen, click again and the files are transferred to the ram expander (or a second disk drive if that is how you have your set-up configured).

There is also a similar option available in the menu functions on the top of screen. By clicking on the 'select' option, you can then select from one of three options; 'all pages'; 'page files' and 'border files'. For instance, if you click on 'page files', all of the files on the page currently on screen will go into reverse video, and you can transfer these to your expander or second disk drive using the method described above.

Another good feature is that you can now transfer eight files to the desktop border instead of the four files that you used to be restricted to. The desktop clock has also been changed so that now, whenever you have the desktop on screen, the time and date are shown in the top right hand section. I recommend that you set

the time and date each time you boot up Geos. This will ensure that your files will be 'stamped' correctly whenever you use them.
geoPaint

● *GeoPaint* has also been considerably up-graded, and we will have a look at some of the new features that have now been made available in Version 2.0. Firstly, it is now possible to create ellipses well as circles by use of the 'constrain' option. If you use 'constrain', as the word implies, it will constrain the image to a circle. However, if you de-select constrain, you can then create ellipses to whatever size and shape you desire. The same feature works with squares and rectangles.

Another excellent new feature is the ability to move the pointer pixel by pixel using the cursor keys. It enables accurate placing of the pointer with a minimum of fuss, and is especially handy when you are doing house plans or electrical layouts etc.

Berkeleys have also transferred the image scaling device from *geoPublish* to this new version of *geoPaint*. You can now copy an image on screen using the edit box and clicking on copy or cut. This places the image into a photo scrap file, then it is simply a matter of defining a new area (any size you like within the current window you are working in), selecting the edit menu and then clicking on paste. The image is pasted into the new region, and you then have the choice of placing it centrally in this region; scaling it to fit, or stretching and scaling the image to fit into the new region.

As well as being able to re-scale your drawings, the new edit box in Version 2 allows you to make a couple of other changes. The image can be made transparent so that you can superimpose it over other images to create great special effects. Also, you can select one of 32 patterns and your image will be redrawn using the chosen pattern (which is displayed in the box as you cycle through the patterns to make your selection). These additional features give a great deal more power and flexibility to the *geoPaint* program.

GeoPaint now also has a user selectable grid to assist with those larger drawings that will require more than one window to complete the work. The only drawback to this feature is that when you turn the grid off at the end of your work, data underneath the grid lines is also erased. The best method is to erase the

geoPaint

grid manually in each section as you finish the work in that area.

Berkeleys also supply you with a transparent acetate grid to place over the drawing or plan you wish to copy. Then, when you turn on the grid on the screen, you simply draw the whole picture square by square, using both of the grids as your measuring guide.

geoWrite

● For those users of the previous version of *GEOS 128* who did not buy *Writers Workshop*, all the additional enhanced features for the word processing side of the package that were found in *Writers*

Workshop now come standard in *GEOS 128 Version 2*. Features such as headers; footers; text formatting; search and replace; decimal tabs; centre, right and full justification; superscript and subscript; single, one and a half and double spacing and so the list goes on. To be quite honest, I would doubt that any serious writer could have used *geoWrite 128* without the features of *Writers Workshop 128* that now come standard in this new version.

Also included with *GEOS 128 Version 2* is the ability to format your document by either full page or individual paragraphs; print options for either high quality, draft or near letter quality modes (provided your printer supports these

geoWrite

GEOS

GRAPHIC ENVIRONMENT OPERATING SYSTEM

Berkeley
Softworks
features), and putting the page number, time and/or date into the header or footer. In addition you also have the capacity to import graphics or text from other *GEOS* programs such as *geo-Paint*, *geoCalc* and *geoFile* etc. All in all, it comes up to what you would expect from a professional style wordprocessing programme.

geoSpell

● As if the above features weren't enough, Berkeley have also bundled *geoSpell* into this new package. *GeoSpell* was another program that used to be sold separately, but now, not only is it included at no extra cost, it also runs much quicker than it used to.

Using the Expander, *geoSpell* checked a document of 1500 words plus (about 2 and 1/3 pages) in just under a minute, not bad by anyone's standards. Not only is *geoSpell* easy to use, but like all other good spell checkers, it allows you to build up your own personal dictionary. So Aunt Anzillito or Uncle Rhiandofile need only be entered once into your personal dictionary and their names will never be queried again (at least not by *geoSpell*).
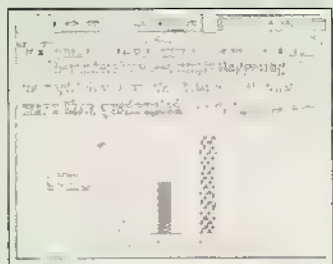

GeoSpell also allows you to search for a word either from the main dictionary or your own personal dictionary, and switching from one to the other is done simply by one click of the mouse. When *geoSpell* queries a word, you have the option of accepting the word in that instance; accepting it in all instances; replacing the word in that instance or replacing it in all instances within the current document. The option of accepting a word in all instances is a handy feature as it stops the word being queried throughout the entire document.

The *geoSpell* dictionary contains approximately 40,000 words and you can add about 10,000 words to your own dictionary. This should be more than enough to meet the need of the bulk of the 'would be' authors out there in computer country.

geoMerge

● *GeoMerge* is another of those programs that used be sold separately, (with *geoDex*) but is now included in the basic package of *GEOS Version 2.0*. For newcomers to computing and/or *GEOS*, as the name implies, *geoMerge* is a program that allows you to send out multiple copies of a single document to any number of individuals or companies.
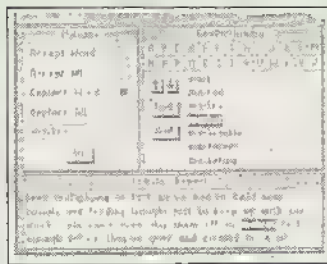

The program is simple to use, but yet is quite powerful. It allows you to use 'IF' and 'ELSE' statements to tailor the program to suit your individual requirements. Differing words or groups of words which may or may not be required within the form letter being produced may be controlled by use of the 'if' and 'else' statements.

Other features

● *GEOS Version 2.0* also includes a text grabber to allow you to import text from other programs such as *Easyscript*, *Paperclip* and *Wordwriter* etc.

An application called "Paint Drivers" is also included which is one of the more under-rated features of *GEOS*. This program allows you to convert *geoWrite* documents to *geoPaint* documents. The big advantage here is that once the one version is completed, you can add art work to any place in the document that you choose. In addition to that, if your *geoWrite* document contained numerous fonts, once it has been converted to a *geoPaint* document, the font files don't have to be on the disk in order to print out your document.

Paint Drivers also allows you to overlay pages to create some great special effects. It is the sort of application that you can spend hours with; have a great deal of fun in using it, and in the meantime, get some excellent rewards for your efforts. ❑

Suite 64
More than just a disk magazine!

by Andrew Farrell

SINCE WE FIRST launched the Suite 64 Disk Magazines some 14 issues ago, the Commodore 64 has seen a rapid improvement in the quality of available software. As a result, many previously commercial programs have been made available. One such program is *The Graphics Workshop*, which appeared on Issue Four. If you're into C64 graphics, this is an ideal package. It enables you to design your own sprites, custom character sets and animation easily. Several machine code routines are included for use in your own programs. As a special to readers of the Commodore 64 Annual, we have included the full documentation here for you to peruse before buying the disk.

The Graphics Workshop

● Welcome to *The Graphics Workshop*. This software is designed as an aid to understanding Commodore 64 graphics. Most aspects of using this package are covered in the Tutorials and Help programs included. This manual is provided as a brief reference guide for using some of the more complex features.

Features

● As you have probably discovered, designing graphics on the Commodore 64 is not the simplest of tasks. *The Graphics Workshop* is designed to make this job simple although it is also designed to do much more. There are comprehensive tutorials included to teach the basics of using the graphics and the design editors.

These include

● **Character Editor** with the ability to rotate, reflect, reverse copy and modify characters. Plus a special option to enable larger shapes to be built up from several characters adjacent to each other. In English that means you can construct your own custom characters for use in your own programs. Several sample character sets are included which you are free to use.

● **Sprite Editor** with similar capabilities to the character editor plus multicolour, trace, expand and shift. All your designs may be saved to disk or tape for later use.

● **Split Screen Generator** sounds like a fairly complex utility. Really it's just a very useful routine that I am sure you will find many applications for. Put simply it allows you to split the standard text screen into three areas, the centre area having its own background colour

and character set. A practical application many involve mixing a complex diagram with the standard Commodore graphics.

● **Sprite Animator** for all those times you wished your sprites would move just that little bit faster. Specify a direction, speed, number of frames and delay between each frame and off they go. Great for writing your own games or just having a bit of fun. Also comes with Animation Editor for playing around with your sprite designs.

● **High Resolution Graphics** is one of the most powerful features of the Commodore 64. With this utility you can easily use some of the less complex features of high-res graphics. It is not a replacement for Ultra-Basic or Simons Basic but you can take it anywhere, no need for a special cartridge.

● **Tutorials** on the use of all of the above. Providing an explanation of all of the above features so that the user may familiarize himself with *The Graphics Workshop*.

LOADING:
Type `LOAD"0:*",8` (return)
When the cursor reappears type:
`RUN` (return)

Title Pages

● After several seconds the Prime Artifax logo will appear. Press any key for *The Graphics Workshop* title page and then press any key to LOAD the main menu. After the version number appears press a key and a list of options will appear on the screen.

Main Menu

● From this menu you may select the majority of the available options in *The Graphics Workshop*. After using any specific function you will be returned to this menu. When you have finished using the workshop, return to this menu, remove the disk from your drive and then turn your computer off.

Use the cursor keys to position the selector next to the option you wish to use.
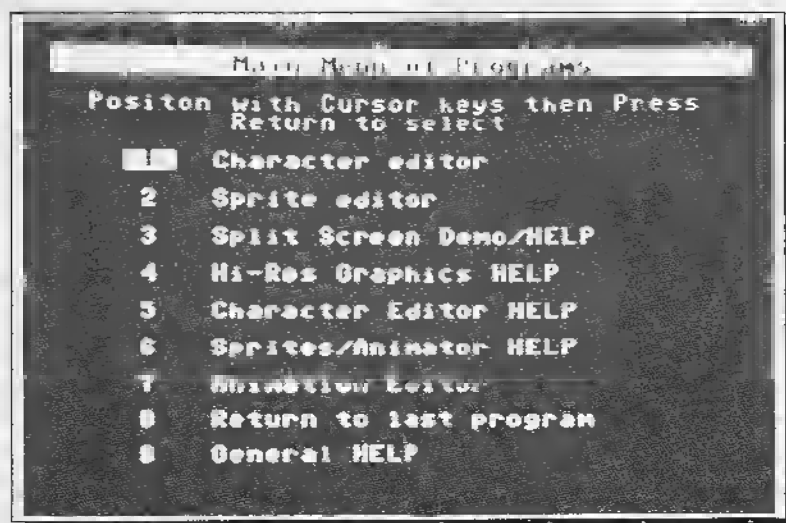

Main Menu

Press the return key when you are certain. Option number eight (return to last program) will only operate under some circumstances.

NB: Before proceeding it is important to understand how things are arranged internally. An area of memory has been set aside for storing your designs. This may be either a new character set or sprite set, but not both. The main menu is always in memory and does not have to be reloaded from disk - except after using Graphics Help.

Character Editor

● Before using the character editor, you will find it very beneficial to use option number five (character Editor Help). The following description will outline how to use the editor itself.

Once LOADED you may choose to redesign from the standard character set or to redesign what is currently in memory. On most occasions you will select `S' for standard. The main editing screen will then appear. At the top left of your screen a matrix will appear representing an expanded version of the character currently being modified. The binary value of each row is displayed in decimal to the right of each row. This is merely provided for reference purposes and is not essential in using redefined characters.

At the top centre is a brief menu or reminder of most of the functions available. Pressing the letter `E' toggles between the current menu and a second one not normally displayed. To the far right the character about to be modified is displayed in its normal form.

The lower half of the screen is a work

area that reflects any changes you may make to the character set in memory. There are 255 characters in all, although only the first 64 are displayed initially. Pressing the Function One Key displays the next 64 characters.

The lower left part of the screen is blank. This area is where you may build up designs by placing several characters next to each other. To enter this area press the `*' key. The cursor keys are now active and any other character pressed will be displayed.

Designing a character

● To modify the character currently displayed in the top right corner press the (up cursor) key. A cursor will now appear on the matrix at the top left of your screen. Use the space bar to turn a dot on and the back arrow key to delete a dot. To finish modifying a character press the (up cursor) key.

Selecting a character

● There are two ways to select the character you wish to edit. The `a' and `z' keys display the previous and next character respectively. Using this method the full design of the character is also displayed in the top left matrix area. Because of this it tends to be a little slow. For faster selection use function key three and five. The character is only displayed in the current character box at the top right of the screen.

Summary of commands

Function 1 - Displays next 64 characters with wrap around.

Function 3 - Next character
Function 4 - Last character
Function 8 - Returns to main menu.

A- Previous character with full display
Z- Next character with full display
F- Rotate left
G- Rotate right

$$\begin{matrix} & I & \\ J & & K \end{matrix}$$ - Shift in that direction
M

C- Copies character into character buffer
Shift C - Swaps character buffer with character about to be modified.
X- Reflects about the X-Axis
Y- Reflects about the Y-Axis

R- Reverse character
+- Fill character
- - Delete character
L- Load character set
S- Save character set

NB: The character buffer is a temporary storage area used for transferring character patterns from one position to another. To copy a character from one position to another press the `C' key, then move to the character you wish to copy to and press shifted `C'.

Sprites - animation editor and sprite editor

● NB: Before using either the Sprite Editor or the Animation Editor and associated routines please select option number six from the main menu.

The Sprite Editor allows you to design up to 32 sprites for use in conjunction
Sprite Editor

with the Sprite Animator or your own programs. Once the program is loaded the main editing screen will appear. The sprite number currently being edited is displayed in the top left corner. To the right is a menu system similar to that of the character editor. Pressing the (up cursor) key displays further menu instructions.

All the function keys are defined according to the lower status line. The Sprite being modified is displayed in expanded form and in normal form on the screen. Most of the controls are fairly self explanatory.

Commond Summory

Function One - Switches to multi-colour mode. This effectively halves the X-resolution of your sprites.

Function Two - Select next sprite
Function Four - Select last sprite
Function Five - Expand on X-Axis
Function Three - Expand on Y-Axis
Function Six - Erase all sprites
Function Seven - Trace mode.
Movement of the cursor is affected by this mode. With TRACE/ON the cursor leaves a trail of dots behind it. With TRACE/DEL the cursor erases all dots it passes over and with TRACE/OFF cursor movement has no effect on the sprite pattern.

C - Copy
Shifted C - Swap (see character editor command summary for details)
R - Reverse
E - Rotate (NB: Part of the sprite may be lost in this process)

```
        I
    J       K - Shift Sprite in that direction
        M
```
Control C - In multi-colour mode selects colour to be used
1 - Modify colour one
2 - Modify colour two
3 - Modify colour three

L - Load sprites
S - Save sprites

Whot to do ofter you have made a design

● *The Graphics Workshop* is unlike most character editors or sprite editors that leave you wondering what to do once you have saved your masterpiece to disk. In this section t will describe the correct procedure for using your own custom characters or sprites in your own programs. Firstly a bit of technical information about graphics.

Both the Sprites and Characters that appear on the Commodore 64 are managed by what is known as the Vic II chip. This chip is only allowed 16K of memory to store any information it is going to display. So to display our own sprites or characters we must be sure the information about how they look is in the right 16K of memory.

When you first turn on your 64 the Vic tt chip is looking at the first 16K of memory which is also busy storing a lot of other bits of information. So there is not a lot of room for our designs, but room enough.

To maximize what space is avaitabte we need to move the standard starting position of the BASIC program area up to make way for our graphics. A program called RAISE BASIC BOOT is included on the Workshop disk to do this for you. Alt you need to do is modify the first line that sets the filename to be loaded to the name of your program.

When you wish to use your program you should load and run the raise basic boot program first. This program will then automatically load and run your program. Now we have room for the designs we must next get them into memory too.

To do this include the lines that follow, only substitute the example names below for the name you gave them.

10 IF E = 0 then E = 1 : LOAD "character set",8,1
20 IE E = 1 then E = 2 : LOAD "sprile set",8,1
30 IF E = 2 then E = 3 : LOAD "routines",8,1

You will notice in line 30 we load in a program called routines. In this line you may load any speciat routines such as the sprite animator or split screen generator. Use the names included in the general help pages from the main menu.

Disploying your sprites

● Information on how to display your sprites is provided in the sprite animation help pages. To view this information select option six from the main menu.

Displaying your chorocters

● As you will have noted from the P.C.G. Help pages, the character set is placed in an area of memory that does not usually allow it to be modified. By changing the pointer to its starting position we can make the 64 look at a different area of memory that contains our own custom character set.

Use the following POKE to do this:

POKE 53272,19

This will only work with character sets which sit at the area starting from 2048. This is the area used by *The Graphics Workshop*. ❏
Screen Output

ONLY COMMODORE AMIGA
MAKES ALL THIS POSSIBLE.

When you first see a Commodore Amiga you'll be amazed at how much it can do. After you've seen its capabilities you won't be surprised that over a million Commodore Amigas have been sold worldwide.

That's because Commodore Amiga is the world's most advanced home and small business computer. It is also the leader in specialised applications such as Desktop Publishing, video graphic design and music.

It talks, animates, educates. Whether you're nine or ninety, student or teacher, Commodore Amiga has the software to aid learning. As well as these applications, it offers a wealth of enter-tainment with the latest hi-tech video games.

The potential of the Commodore Amiga doesn't stop there. Commodore Amiga has thousands of software packages available as well as a huge range of supporting magazines.

The Commodore Amiga 500 and 2000 make so much possible you're limited only by your imagination.

For further information and your nearest Commodore dealer phone (008) 023 233.

Commodore in Education

"What did you do at school today?"
*"We learnt about the Commodore."*

TO MANY SCHOOL students, "computer" and "Commodore" are virtually synonymous. The reason is, of course, that to many school students (indeed, most school students) the computer IS a Commodore.

The reason for this is not difficult to ascertain. Commodore computers are, by far, the world's largest selling brand. And the Commodore 64 is, by far, the world's largest selling individual model.

First released in 1983, the Commodore 64 followed the phenomenal success of the Commodore VIC 20. With over one million sold by 1982, the VIC 20 was the largest installed base of any computer built to date.

In a prophetic statement, Shearson/American Express said "The Commodore 64 could be the most important new product introduced since the birth of the computer industry."

How right they were!

Ticket to Paris - as you book a hotel room, visit museums, explore the city or try French cuisine, you learn about French culture, language, history, art, banking, shopping and much more.

In 1983, sales of the Commodore 64 eclipsed even those of the VIC 20. In 1984, the Commodore 64 was voted "Home Computer of the Year" in several countries around the world.

Then, in 1986, Commodore announced the release of the 64C - a redesigned Commodore 64, complete with GEOS - a powerful new operating system.

What had been an extremely popular home computer now became even more popular. Most of all, its low cost allowed families to enter the exciting world of computing without spending a lot of money.

For exactly the same reason, Commodore 64s became the computer of choice for a huge number of schools, colleges and other educational establishments.

Instead of having one computer of the teacher's desk that the class could be shown, the low price of the Commodore 64 meant that schools could afford to place them on the students' desks - where they could be used.

Yet schools discovered that the low price of the Commodore did not mean a sacrifice in power of performance. It would more than stand up with the best company.

This power has been one of the Commodore 64's major strengths. It was, and is, a power that computer software writers found easy to convert into powerful programs.

Like the machine itself, the software range for the Commodore 64 is the world's largest, with a significant proportion of this written specifically for the education area.

In a snowballing effect, the wide availability of a powerful, low cost com-
Designasaurus · learning game with multiple skill levels. Survive as a dinosaur, create your own prehistoric giants.

puter meant that excellent software became available - at low cost. Because excellent low cost software was available, the machine itself gained further popularity. And so on.

The huge volume of software created its own economies of scale. Commodore 64 software tends to be lower in price than software for other machines.

The Dataflow Computer Services catalogue (specialists in educational software) shows several packages with versions for several types of computers. The Commodore 64 software is usually significantly cheaper than the same software for other

Fun School 2 series - Multiple subjects are presented in game format. Animation and sound effects are used.

computers!

For example, the popular Broderbund *Type!* software sells for $49.95 and $59.95 in Apple and IBM formats - yet the C64 version sells for only $39.95! *The Print Shop*, one of the most popular programs ever sold (and used in huge numbers in schools) is up to $25 cheaper for the C64 than other models.

It's fair to say that companies such as

Number Farm - Early Childhood Software. A fun way for youngsters to learn numerals, number words, numerical order, counting skills, and beginning number concepts.

Dataflow not only helped promote the C64 - but were themselves promoted by it. Dataflow was established solely to meet the needs of educational software in Australia. A very significant proportion of their sales is in the C64 area.

They say success breeds success. In the case of the C64 and 64C, it's a truism that's true: to date over ten million Commodore 64s and 128s (the 64's "big brother") have been sold around the world.

When you think about it, that's a pretty staggering figure for one type of computer!

The fact that the Commodore 64 was selling very well into the education market did not escape Commodore themselves, of course.

To promote and market to schools and other educational bodies, Commodore set up a special division, with a function extending far beyond the normal "marketing" roles.

For example, it assisted school teachers in becoming computer "literate", Commodore believed, rightly so, that teachers needed to know the technology before they could teach it.
This assistance continues even today, with Commodore spending a lot of money, time and effort in keeping educators educated. Indeed, several large sponsorships and grants were announced during 1989 to various schools, colleges and universities - precisely for this purpose.

They assisted software writers, particularly in the education field. A typical example of the way this has worked for the benefit of education in Australia is in the Adelaide suburb of Angle Park, where Angle Park Computing Centre has been set up by the South Australian Department of Education (see the article on page 40).

Angle Park Computing Centre

Angle Park has had a very significant input to the way computers have been introduced to schools, and how they continue to be used. Because of the penetration of Commodore 64 machines into the South Australian market, a large proportion of their work has been in the development of the C64 within the South Australian education system.

For instance, they have researched

computers!

For example, the popular Broderbund *Type!* software sells for $49.95 and $59.95 in Apple and IBM formats - yet the C64 version sells for only $39.95! *The Print Shop*, one of the most popular programs ever sold (and used in huge numbers in schools) is up to $25 cheaper for the C64 than other models.

It's fair to say that companies such as

Number Farm - Early Childhood Software. A fun way for youngsters to learn numerals, number words, numerical order, counting skills, and beginning number concepts.

Dataflow not only helped promote the C64 - but were themselves promoted by it. Dataflow was established solely to meet the needs of educational software in Australia. A very significant proportion of their sales is in the C64 area.

They say success breeds success. In the case of the C64 and 64C, it's a truism that's true: to date over ten million Commodore 64s and 128s (the 64's "big brother") have been sold around the world.

When you think about it, that's a pretty staggering figure for one type of computer!

The fact that the Commodore 64 was selling very well into the education market did not escape Commodore themselves, of course.

To promote and market to schools and other educational bodies, Commodore set up a special division, with a function extending far beyond the normal "marketing" roles.

For example, it assisted school teachers in becoming computer "literate". Commodore believed, rightly so, that teachers needed to know the technology before they could teach it.

This assistance continues even today, with Commodore spending a lot of money, time and effort in keeping educators educated. Indeed, several large sponsorships and grants were announced during 1989 to various schools, colleges and universities - precisely for this purpose.

They assisted software writers, particularly in the education field. A typical example of the way this has worked for the benefit of education in Australia is in the Adelaide suburb of Angle Park, where Angle Park Computing Centre has been set up by the South Australian Department of Education (see the article on page 40).

troduced LOGO and the C64 to first year primary students with amazing results.

While Angle Park Computing Centre has been deeply involved in computer and software evaluation, even more significant has been their own softwaare output. Marketed under the "Satchel" lable, their software has become very widely used throughout the school system and indeed the home market - not only in South Australia, but in other states as well.

For further information or a Satchel Educational Software Catalog, contact Satchel at Angle Park Computing Centre, Cowan St, Angle Park SA 5010, (08) 243 5559. Fax (08) 347 1781.

Commodore work in very closely with the various state education departments to ensure that education is kept abreast of the latest developments.

Of special interest is the curriculum development work currently being undertaken by selected teacher's eolleges/ universities and local primary schools.

This exciting venture, heavily sponsored by Commodore, will ensure a continuation of high quality Australian educational software speeifically targeted to the needs of Australian students.

(For distributors of the programs illustrated, see the Education section of the Software Guide, page 68.)

Speed Reader II is designed to help increase reading speed and improve comprehension.

Education with Satchel Software

IT WOULD BE fair to say that until recently, we've been a little unfortunate "Down Under". We may be the lucky country by name but that doesn't necessarily apply to the Australia that gets talked about in the annals of international computer software research and development. Whereas the UK and the US have plenty of home grown software houses developing the software their countrymen demand, we in Oz are expected to aeeept whatever comes from overseas and make do.

Although things are now beginning to take a turn for the better, the reality is that unless one is prepared to spend big dough on designer software, one must suffer from the "adaptation blues". UK accounting software has to be "adapted" to our tax system - VAT talk being rather redundant. Imperial needs converting to metric, American English needs translating into fair-dinkum language, and educational programs need to be adapted to suit an Australian curriculum.

Well, there have been goings on down here. As the writers and designers of serious software begin to realise the potential market there is in Australia, they make time to alter pound signs, add u's to American "...or" endings, redesign tax functions and so on. But it's slow in places, particularly educational software. There is only one really satisfactory answer to the problem of Australianising software and it's this: get Aussies to write the stuff.

The problem with educational software has been that offerings from overseas are not always entirely relevant, accurate or appropriate to our children. Teachers and parents hesitate because our children weren't obviously the intended "target audience". Clearly the solution is to have the software developed in Australia, by people who are aware of the needs of Australian students and teachers, and who can therefore shape the software to slot conveniently into the curricula of the students at various year levels.

Until recently, that had mostly been too much to ask. Computers were always too expensive, incapable of the tasks required and hidden behind a curtain of esoteric "computerese". Teachers feared the machines and the idea of "learning a new language", assuming they were even offered the opportunity to consider the viability of using computers in the classroom. We've moved on a bit since then, happily.

Most schools are now using or considering the use of computers in some shape or form, and much of the fear has been dispelled. There's even a Centre down in South Australia dedicated to supplying schools, teachers and students with relevant, high quality and well priced educational software. Let's pay them a visit.

A visit to Angle Park

● Angle Park Computing Centre is an Education Department of South Australia project established entirely to research and develop the use of computers in primary and secondary education in

Granny's Garden (Satchel Soltware) - a structured adventure game for younger children.

South Australia. In this capacity, the Centre is constantly developing software for distribution and use in schools and to this end some years ago started the Satchel label of software products.

What in one way really sets Angle Park apart from other software development people is the sheer volume of information and knowledge they have amassed in the time the Centre has been operating. Remarkably, the Centre has been in operation since 1967, putting APCC in a unique position to assess and criticize the use of computers in education.

The staff come from various backgrounds, they include professional educators, programmers, document writers and support staff. The educators are experienced teachers and administrators and together share an expertise that covers all levels of primary and secondary education. At the same time as they are working at Angle Park, the staff is also involved in advisory and consultancy roles, making for busy workdays and well deserved holidays.

The staff at APCC share a common understanding that computers offer tremendous assistance and challenge to teachers and students alike. In recent years they have been heavily involved in developing programs to facilitate the use of various computers in schools · particularly IBM-compatible machines.

The aims of Angle Park Computing Centre can be roughly divided into four areas:
● training and development of teachers
● support of human networks and information dissemination
● research, monitoring and evaluation of schools' computing
● development of courses, materials and software.

So in fact, APCC goes far beyond simply writing and distributing software, but acts as an organising body, as well as a resource base for schools in South Australia, and beyond. APCC are involved in developing a network and BBS system for South Australian schools, thus allowing teachers to access a number of databas-

es, and a far greater information base than would ever otherwise have been possible. This sort of work requires serious dedication and above all, a level of expertise normally not expected from anything less than a private consulting firm or the like.

What's in Satchel?

Satchel, although developed primarily for use in classrooms and in the context of a balanced curriculum, can also be used to great satisfaction in the home as a support tool to classroom work. In fact, a lot of the Satchel range has so carefully been "disguised" as fun software that children will likely play these "games" without ever consciously recognising the underlying principles being taught. Some Satchel software titles can thus be seen as an alternative to shoot-em-ups and adventures, as well as, more obviously, educational tools.

Conscious of the nature of software usage in schools and at home, Angle

Park have created an attractive pricing policy to accompany their Satchel range. Aware of the critical issues of copyright and price, APCC have identified these needs:
● a relatively low unit price for packages
● a reasonable site licence policy
● availability of additional manuals with the site license, and
● availability of concessional packages for student and teacher use at home.

Now, although not all of the above are really relevant to the average reader of this article, they do go to illustrate a point well: a local software developer with a local distribution area can afford to spend time sorting out matters that an overseas company might not be able to consider.
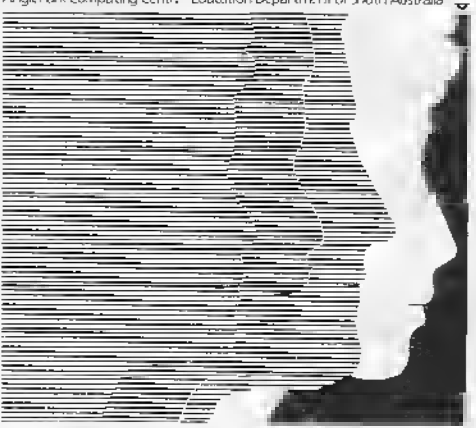

Satchel offers a low, single-unit price and a site licence (mainly for a school environment) about 15 times the unit price. Also, "attractive" prices are offered for students and teachers willing to buy an extra copy for private use.

The Satchel product range is the result of years of research and development in South Australian schools. As Angle Park explain: "The Satchel product range results from extensive experience with the use of computers in schools and reflects the best classroom practices in implementing computer applications. The Satchel packages exploit fully the capabilities of the equipment and the potential of the computer as a tool for use in the classroom by students and teachers. Each package is tested in the classroom environment, has high quality documentation and must meet strict Education Department approval guidelines."

What lies ahead

● With the mainstream slowly catching up with Angle Park, the Centre has chosen to operate on the principle of providing a service in those areas of activity that cannot be reasonably expected to be serviced within the school community. This in practice means that the Centre is expecting that as schools acquire knowledge and

for the Commodore 64 and Amstrad 6128

understanding, they will no longer need to rely on APCC for support, but will rather train and equip teachers internally. Angle Park are also working towards decentralising the training programs away from the Centre by developing self-teach packs that teachers can use and learn at a time and place convenient to them.

APCC is also spending time on the further development of Satchel software. It is refreshing to see a quality, well-priced alternative to the commercial educational packages on the shelves. Angle Park Computing Centre are a force to be reckoned with in South Australia and are now making their presence felt in other states as well, which can only be a good thing.

Here's a closer look at the range of Satchel titles :-

Mathsbooster

● High on the list of the most mundane things to do in one's life must be memorising the multiplication tables. Our memories paint a picture of a blackboard, covered in columns of numbers and equations behind the "Drill Instructor" cum teacher sitting pensive at a very big desk. Nightmares are made of this. Fear would consume your youthful confidence as your name was called. What embarrassment when you couldn't remember the answers.

Thank goodness there's someone out there with a little more creativity than the Byzantine educators some of us were unlucky enough to have! *Mathsbooster* "disguises" the rote learning of the multiplication tables and the other arithmetic operations behind a game of *Space Invaders*.

As pieces of space junk fall from geostationary orbit towards the earth, it is the sdent's task to save the world by

having each piece of debris intercepted by a rocket which then carries it safely off into space. The rocket however, will only intercept the piece of debris if the answer to an equation is entered via the keyboard. If the equation is wrongly answered, the pieces continue to fall, but if the answer is correct, there's one less piece left falling.

There are six pieces at which a rocket must be fired, so each "wave" consists of six equations to answer. The speed at which the pieces fall increases with every screen completed, until it's pretty well impossible to beat the pace. The challenge of beating the clock is addictive, even if it all only comes down to solving equations.

After every successful completion of two "waves" of debris, the student has to intercept the "shuttle". This makes for a nice sense of achievement.

Behind what the child sees, there's more going on. The teacher or parent can control the level of difficulty and type of equation being drilled, so as to best help each individual child. *Mathsbooster* can drill the child in all the four areas of addition, subtraction, division and multiplication, or some combinations of these and for each of these the parent or teacher can determine the precise number range the child will be working with, as well as this, the speed at which the objects fall can also be controlled, to help make the game a challenge for every child.

So, the game could effectively be used in a classroom situation with each child working on their own copy of the program; that copy entirely customised to the needs and weaknesses of that child.

At home, *Mathsbooster* can be used effectively to support the arithmetic work being taught at school, while the child all the while is finding enjoyment and challenge from what used to be mundane.

Crosswiz

● Taking a very different tack now, *Crosswiz* is a gem of a program that allows students to create their own crosswords. The computer takes care of everything,

from the positioning of the words in the crossword, to the printing out of an attractive, neat final product. It is recommended for students from approximately grade 3 upwards, although with assistance, younger children might also find enjoyment from it.

Immediately obvious is the user-friendliness of the package, this being virtually a trademark of Satchel. You simply load *Crosswiz*, and you are presented with the main menu. From here it's straight into creating a new crossword. The child enters a word via the keyboard, positions it on the board (20 x 20 characters) and then provides a clue. The next word is then entered into the computer, which automatically positions that word in a logical position. If the student preferred the word to go elsewhere, the program will automatically determine every possible position for the word within the crossword. When the student is happy with the position of the word he/she drops the word in and then enters a clue. This continues until there is no more room for words (usually about 40 words will fit) or the student decides there are enough words entered.

As a jazzy little detail, the student can now alter the crossword to get away from the basic square shape by removing some of the back spaces that are left behind. Different shapes can be drawn to create impressive designs.

The final product can then be printed out to give to fellow students or family members. It is easy to imagine what home or class projects can be developed around this program. Whatever the case, the student receives a tremendous sense of achievement and a present to give a friend.

A few points to note. I was able in my experimenting to create a crossword too complex for the *Crosswiz*. I wanted to squeeze a word quite correctly between two others, but *Crosswiz* didn't recognise the legitimacy of this. Still, I doubt your average pre to mid-teen would devise such a complex situation.

Secondly, *Crosswiz* has no spell-checking facility. It will accept wrongly spelt words. So if your child presents you with a crossword to do, be prepared. The answer to "A big grey animal with a trunk and tusks" may well not fit in
the space provided if the expected answer is "Elefant". Still, I guess this adds another dimension to *Crosswiz*, educationally speaking!

Picture Book

● Arguably one of the world's cheapest desktop publishing packages ever developed, *Picture Book* allows students to write their own book, with pictures too.

The book can be up to 10 pages long, with pictures and text combined on each page. On disk, over 200 graphic images are provided for the child to use in the book, or alternatively the child can create his/her own to give a more personal touch.

> *"Arguably one of the world's cheapest desktop publishing packages"*

The screen is divided up into two windows: one for the picture and one for the text. The text window is in fact a simplified word processor, allowing up to six lines of text per page. It includes wordwrap, centring and editing facilities, giving primary school children an introduction to word processing at the same time.

Some trouble has been gone to in the graphics department as well. Your own graphic images or those taken from disk can be shrunk or enlarged, flipped horizontally and their on-screen colour can be changed. A number of images can e pasted onto one page at the same time, also allowing students to create reasonably complex pictures from the images provided.

As an added feature, the entire book can be dumped to a printer, page by page. The child can then colour the pictures in as a related exercise. From the point of a teacher, the applications are boundless. The accompanying manual recommends a number of possible applications such as progressive stories, where a different child writes each page, or an anecdotal story where the child relates an experience accompanied by pictures.

Jara-Tava, the Isle of Fire

● Adventure game for 9-10 year olds that takes place on a mythical tropical island. Actually tropical islands is more accurate, for while the adventure begins on an island named Jara-Mau, the adven-

turer must travel to Jara-Tava, the infamous Isle of Fire, to be successful.

According to the teacher's guide accompanying the program, Jara-TAva has been as much of an odyssey for the authors as it will be for the players. Though it now bears little resemblance, *Jara-Tava* began as *Treasure Island* or *Treasure Isle*, a

LANGUAGE

Writing and Speaking

Adventure games generally, and Jara-Tava specifically, can spark the imagination and are excellent in motivating children to write.

Keeping a Diary

The children could keep a diary of their experiences in the adventure. This diary could later provide the basis of a book about the adventure.

Letters to Family

As an alternative to keeping a diary the children could write letters to members of their family detailing their travels.

Jara-Tava Resource Book - Page 4

One of the
Mini-themes is on whales

public domain and Pathweaver adventure available for some time in South Australia. During this time it established itself as something of a standard for middle primary children or with those new to adventure games. When the authors began considering options for an illustrated adventure for the middle primary school it was decided to capitalise on the success of Treasure Island and to extract the full potential of a "proven winner". But fear not! While the basic premise and some locations remain unchanged, there is a great deal that is new.

Three specific aims were decided upon. Firstly, the adventure game had to be reasonably challenging for children aged 9-10 years old, as well as being enjoyable and of good quality. Secondly, it was accepted that the program would be developed for incorporation into the greater theme of pirates. Thirdly, the game should incorporate a number of smaller elements which should stimulate the children's thinking on the various themes presented in the program.

The general aims expressed in the teacher's guide speak of something greater than simply an adventure game. These aims are too many to list, but point to something more akin to a major class project incorporating *Jara-Tava*. This adventure game is therefore only a small part of the greater project as proposed by Angle Park. In fact, included with the program is a resource disk which includes many hours worth of additional material for use by children in the classroom.

This leads to one important point. Although the educational software is generally for use in the home, and under parental supervision, an exception to some extend must be made in the case of *Jara-Tava*.

Clearly, it would be too much to ask of most parents to create something which truly exploits the full potential of *Jara-Tava*. As the teacher's guide explains "*Jara-Tava* requires the skilled hand of an enlightened and caring teacher to capitalise on the possibilities provided." This

said, with no greater effort than would be normally expected of parents, the adventure game itself can be played with great enjoyment by the child.

The adventure begins

● Quite a leap forward for the authors and the students who haven't played many adventure programs before, *Jara-Tava* incorporates full colour graphics and an intelligent parser that allows the children to enter full sentences (no more stilted two-word phrases!). The adventure is loosely based around the system developed in 'Twist-a-Plot" books where the child makes a number of decisions in the adventure which determine the direction of the game - for better or for worse, presumably.

The synopsis is simple enough. *Jara-Tava, The Isle of Fire* is an adventure in which the player is in search of pirate treasure on deserted tropical islands. You have been bequeathed a map of an island called Jara-Mau and the means (traveller's cheques and airline tickets) to travel to it. The adventure proper begins as a launch drops you off on a beach of Jara-Mau. Your goal is to recover the treasure of Captain Kidd hidden somewhere, you are led to believe, on the island of Jara-Mau.

To find and recover the treasure the adventurer must do three main things. Firstly, recognise that the treasure is on Jara-Tava, and not on Jara-Mau; secondly, find a way of getting over from Jara-Mau to Jara-Tava; and thirdly, recover the treasure from Jara-Tava before the Volcano erupts and destroys the island.
On Jara-Mau, the adventurer wanders around under no threat. There is no clock to beat and the intention of the authors here is to challenge the child more on logic, reasoning and the other principles behind playing adventure games, rather than making it simply a race against time. A map has been given which can be referred to at any time, this gives a picture of the island and an indication of where the child must be. Since the island is rather large (over 20 different locations), this isn't really giving the

game away. Strewn over Jara-Mau are a number of items which may or may not be of use in solving the adventure. It's really up to the child to decide.

Don't be deceived into thinking that since this adventure is for 9-10 year olds it's going to be a walkover. In fact, I recommend parents and teachers, particularly if you haven't played a computer adventure game before, to have a go. And I mean WITHOUT reading the answer pages of the teacher's guide.

Cleverly, the adventure has been designed around a number of crucial decision times - four in all. These determine the fate of the adventurer and the path of the game. A number of hints are placed around the game to encourage the right answer.

Worthy of note is that there is not just one correct way to win this game. In face, there are four ways of crossing the shark-infested channel between Jara-Mau and Jara-Tava, and once on Jara-Tava, three more ways to find the hidden treasure. So two children sitting next to each other can both find the treasure, but having played two totally different games! Thus the challenge to the adventurer is to make each decision on the basis of the information known to him/her. This calls for concentration, logic and thinking far enough ahead to consider consequences of ac-

tions not yet performed.

Jara-Tava is by no means a very difficult or involved adventure and it was never intended to be that. It is a good introduction to the logic and style of larger adventure games such as Level 9 and Sierra games.

Where *Jara-Tava* wins over the rest however, is that it is tailored specifically to 9-10 year olds, in the context of their curriculum. This adventure is intended as a stimulant to encourage thought on pirates, sharks, submarines (yes, there is one in the game somewhere!) and other themes encountered in the game.

Now, parents may not be able to exploit the full potential of the package, particularly the resource disk with the additional database and other programs, but you will find that with only a little push, children will go a long way all on their own.

Jara-Tava has been well pitched to the middle to upper primary age group. It's simple enough that it is immediately accessible, even to the child who's never seen a computer keyboard before, yet challenges the child's powers of reasoning and deduction. Best of all, this game is fun, and making education fun while not compromising standards is a challenge Angle Park Computing Centre are well on the way to licking.

Available from Satchel Software, Angle Park Computing Centre, Cowan St, Angle Park, SA 5010. (08) 243 5559. Fax: (08) 347 1781. RRP for the programs mentioned here is $40.00 each for the C64. ◻

C64 Programmer Subroutines

by David Williams

Every programmer needs a library of subroutines. Why re-invent the wheel? If you come up with a good error-handling routine, you should use it in all your programs that need one, instead of writing a new one each time. In fact, a modular approach that this can lead to, is a good habit to get into when programming. Here are some subroutines that I use, and you may find useful:-

Random numbers

Random numbers in assembly language are normally very hard to create.

Usually some obscure formula is used, but it is possible to use the SID chips voice 3. This is done by setting the high byte of the frequency register, and selecting the noise waveform. The volume of the SID chip is set to zero.

```
10 random = 54299 ;random number
generator
20 lda #$fl30 sta 54287 ;voice 3 frequency
40 lda #$8050 sta 54290 ;voice 3 control
register
60 sta 54296 ;volume
```

and from then on, just lda random for a number from 0 to 255.

Print @x,y

Some computers offer a 'print@x,y' command, that allows the user to print to a certain part of the screen. On the 128 this can be done by the Char command. On the 64 however, the vertical position can be set by location 214, and the horizontal position by location 211. Put a print command between the two.

```
10 poke 214,15:print :poke 211,10
20 print "hello world"
```

The function keys on the 128 are easily defined by the Key command. However, there are actually ten function keys, shift/run-stop and help being the other two. They can be redefined by:-

sys24812,,8,,,"string" for shift/run-stop, and sys24812,,9,,,"string" for help.

Fake cursor

How about a telecommunications simulator where a cursor zips along, leaving characters behind it? To improve this, you could add some sort of sound.

```
100 for i=1 to len(b$):a$=mid$(b$,i,1)
110 print"[rvson] [rvsoff]";
120 for j=1 to 50:next
130 print"[left] [left]"a$;:next:next
140 return
```

To use this, put your message in the variable b$ and gosub 100.

Wait!

Instead of the usual "press a key to continue" type message, if your program uses a joystick, you can use:-

wait 56320,16,240

to wait for the fire button to be pressed. Note that this is for port two. For port one, use 56321.

Error trapping

The Commodore 128 has some very good commands to help you edit BASIC 7.0 programs. Here's a quick bug-trapping routine to add to your programs.

```
1 trap 2:goto 10
2 scnclr :help :print err$(er):end
10 program starts here
```

80 column fade in/out

The 80-column chip in the 128 can provide some pretty good special effects, due to it's multitude of registers. Here is a fade-out and fade-in routine for the text screen.

```
10 for i=8to .step -1
```

```
20 sys 52648,i,23 :for d=.to 99:next
30 next :sys 52648,96,34
40 scnclr :rem create new screen
100 for i=.to 8:for d=.to 99:next
110 sys 52648,i,23:next
```

Menus

I have written several menus for disks containing both 64 and 128 programs. The menu therefore needs to determine whether the computer is a 64 or 128, in 40 or 80 columns

```
10 a=40:if fre(1)=fre(.)then 100
20 graphic clr:it rgr(.)=5then a=80
```

This sets the variable a to 40, for 40 columns. The amount of free memory function is then used, as on the 64 the number between the brackets is insignificant. Fre(1) will be equal to fre(.). On the 128, however, the two return the free memory in bank 0 and 1, and it is unlikely that they will be even close. If they are equal, the computer is a 64, and so we jump to line 100. If not, the computer is 128, and the Return GRaphic function is used to tell us if we are in 40 or 80 columns, and the variable a changed accordingly.

Assembler print

A lot of assembly language listings I have seen print messages by using a loop and CHROUT. However, there are lots and lots of useful routines in the Kernel. At $ab1e is a routine called STROUT (string out, as opposed to character out) which does just what we want.

```
10 strout = $ab1e
20 lda #<message
30 ldy #>message
40 jsr strout
50 rts
60 message .byte 'text up to 255 characters'
70 .byte 0 ;terminating zero byte required
```

There are so many useful subroutines, and quick programming tricks to be done on a Commodore 64 or 128. This short article can't even touch the surface. I hope you will find these examples interesting, and even inspiring. ⊔

will want some kind of special, non-printing character to tell it that the information which follows is to be acted upon, not printed - for example, a reversed asterisk. This would be followed by abbreviations for the control instructions, rather like this:-

*lm10:rm70

The formatted text-width is 60 columns, but in edit mode your on-screen text will still be a full 80 columns wide. The control code sequence '"*lm10:rm70" will be visible on screen and will not be interpreted.

In an output mode, such as print-to-screen (commonly called Display or Video Preview), the control codes will be intercepted by the program and the margin information incorporated into the screen display, so that now the text will be 60 columns wide and set 10 characters in from the left. Other formatting commands and printer control codes will be treated in much the same way.

Operation

● There is a further subdivision of program types which may affect your personal preference, and that is whether a program is menu-driven or command-driven. In a menu-driven program, each function of the program and printer is accessed via the choice of an item on a menu. That choice may lead to another menu, and that to another and so on, until the required command is reached.

The big advantage here is that you don't have to remember seemingly illogical keystrokes to get your desired result - hopefully the menu will have been carefully designed so that the choices you are required to make are logical and lead you intuitively to the command you want. A disadvantage is speed, or rather, lack of it - things can get pretty slow as you hunt and peck your way through a complicated menu system. *SuperScript* from Precision Software is an example of a menu-driven word processor.

In a command driven program, instructions are issued directly by certain keystrokes in combination with a series of master keys, such as Control, Escape, Run/Stop, Commodore key, etc. The advantage is speed - the disadvantage is that in a powerful program there are so many features to be accessed that inevitably, many keystroke combinations are illogical and easily forgotten. Examples:

SHIFT RUN/STOP for "go to end of text", ESCAPE SHIFT < for "Italics on".

Paperclip III from Batteries Included is command driven. It runs out of logical commands for some of its functions, but is otherwise so good and powerful I am prepared to forgive it for any little foibles it may contain! Likewise *Word-Star*.

Probably the best system is a combination of commands and menus, and here, *SuperScript* shines. Under menu control, to go to the end of your document you would hit the F1 key to call up the main menu, then cursor across and highlight "Go". Another menu appears, listing choices of where in the document you may go.
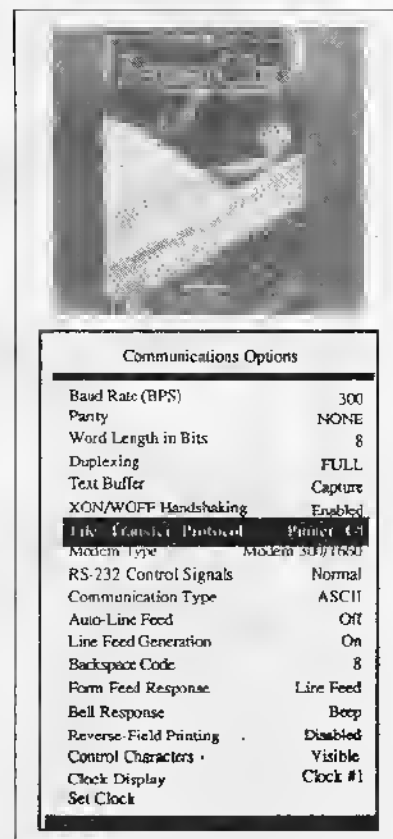

Cursor across and highlight "End" and the program will respond and take you to the end of the document. Under command control, you would enter F1GE and obtain instant response. (F1 to call the main menu, G for Go, E for End.) There are also commands based on CONTROL plus one other key which give rapid, two-keystroke access to the most commonly used commands, rather than the three or four keystrokes often required by the menu structure.

Technical terms it helps to know about

● "Wordwrap" is a mysterious term you'll often encounter when dealing with word processing or with any program which presents text on the screen, such as a communications program. It is merely the facility whereby a word won't be broken at the end of a line on the screen or page.

Instead the program works out if there's room on the line to place the word, and if there isn't it is "wrapped around" to the next line. Virtually all word processors use wordwrap and virtually all of them allow it to be turned on and off.

"Defaults" simply means the setting or series of settings the program will assume unless told otherwise. For example, many word processors default to a left margin setting of 10 and a right margin of 70, though of course, you can set them to anything you wish. There are many other settings which the program must know, and which will contain

| Communications Options	
Baud Rate (BPS)	300
Parity	NONE
Word Length in Bits	8
Duplexing	FULL
Text Buffer	Capture
XON/XOFF Handshaking	Enabled
File Transfer Protocol	Punter C1
Modem Type	Modem 300/1650
RS-232 Control Signals	Normal
Communication Type	ASCII
Auto-Line Feed	Off
Line Feed Generation	On
Backspace Code	8
Form Feed Response	Line Feed
Bell Response	Beep
Reverse-Field Printing	Disabled
Control Characters	Visible
Clock Display	Clock #1
Set Clock	

Paperclip III

default values so that the program will work, even if you forget about them.

"ASCII". In any dealings with text, communications and disk files, you will encounter the term ASCII, an acronym for "American Standard Code for Information Interchange". Pronounce it as "ass-key". If we all do that, that will be about the only thing standard about it! Every computer manufacturer, including Commodore, has its own version of AS-

Paperclip III main menu
GeoWrite
Superscript

Picture from Paperclip III

Cit, and that has spawned an industry which does nothing but supply translators, called interfaces, which allow Brand X computer to talk to Brand Y printer and have the Queen's English print out on Brand Z paper. If you haven't got a printer yet and are intending to buy non-Commodore, you will need an interface, either as an accessory or built into the printer.

"**Display**". If you can track down a C128, it's a versatile computer and can drive either a 40 or 80 column monitor, plus a TV - all three together if you're playing to an audience! If you're limited to one or the other, then make sure that the word processing software you choose works in the number of columns you're limited to. Most programs allow a choice, but there are exceptions.

What should you look for in a word processor?

● Well, like just about any other purchase you might want to make, it depends on your needs. If your word processing will be limited to the occasional letter or straightforward use of your computer as a substitute for a typewriter, then a simple word processing program is what you need. You may not even have to pay for it. *Run* and *Compute!*, both Commodore magazines from

the USA, have published type-in word processors for both the 64 and the 128.

Having used both (*Runscript* and *Speedscript*, respectively) in the 64 versions which are really very good, I can see no reason why the 128 versions should not be just as good or better. Other magazines jumped on that bandwagon, but these two were the first.

I suggest they, and similar programs from other magazines, represent the best value for money of ANY word processor because they are yours for the cost of a magazine plus about six hours of your time. If you don't cost the time you spend on your hobby, that's about six dollars all up!

If that's too much, try a user group.

On the other hand, if you're a serious or even intermediate writer you will, at some time, want some bells and whistles. Things like ASCII translation, full control over the printer driver, comprehensive range functions including column-move and column-delete, automatic horizontal and vertical addition in tables of figures, inbuilt calculators, mailmerge, integration with a database, fast cursor movement, telecommunications, inbuilt spell checker, automatic detection and use of RAM expansion, flexible use of disk drives. The list is endless and limited only by the programmer's imagination and the price the market is prepared to pay. ❏

Word processing glossary

Justified type: This means that you can format the page so the lines begin and end exactly at the left and right margins. The computer adds the correct amount of space between words to allow this to happen. Many books and magazines use justified type, it can look very professional. This article, for instance, is set in justified type. It only works well with fairly wide sections of type, though. Set in columns too narrow, justified type can look very strange.

Flush left, ragged right: This is the ordinary way of formatting a page. It results in an even line down the left hand side of the page, and the lines ending within a right margin, but not evenly. Flush left, ragged right is basically what you get from an ordinary typewriter.

Bold and italics type: Simple commands in the word processing program will allow you to nominate certain

pieces of copy that you wish to be bold or italics. It is a neat way of emphasising a word or sentence, and looks far more professional than underlining, although you can of course underline should you want to.

Spelling Checker: Runs through text and stops when a spelling error is detected. Allows you to add and delete from the dictionary thus creating your own dictionary with specialised words.

Subscripts and superscripts: These are the little numerals or characters that appear slightly above or below the line of type. They are often used in academic documents, and are simple to employ with a word processing program.

Variable pitches: Changing pitch means you can alter the way the type looks. You can make the type condensed or with more space around the letters, depending on what is required.

Headers and footers: These are the explanatory lines at the top and bottom of pages. Again, they are often used in academic treatises, or in newsletters. The computer, formatted correctly, will automatically enter headers and footers on every page of the document.

Fonts: A font is a particular type style. Serif fonts have the little squiggly bits on the letters, and sans serif fonts are more modern characters without serifs. Some word processing programs will allow you to choose the font style.

With all these commands at your fingertips, you can do just about anything with your pages. You can produce a slick piece of finished copy, a professional letter, or a long, legible article. The permutations are endless.

WYSIWYG: What you see on the screen is what you get when you print out. ❏

We don't only give you a Business Computer.

# We give you a choice.

Commodore's extensive range of PCs gives you a wide choice of PC options.

A choice of configurations and concepts from Amiga graphics to powerful AT standard performance.
See the full range of Commodore business computers at your Commodore dealer now.
See Your Nearest Commodore Dealer.

Commodore Amiga 500
With features such as multitasking and upgrading options, it's Australia's best selling small business computer.*

Commodore Amiga 2000
A true investment, because of its capability to expand, it offers multitasking to ensure versatility and increased productivity.

Commodore PC Colt
The quality PC-XT equivalent, ready to start work with colour or mono capability.
Commodore PC 10 III
The small footprint of this PC will save your desk space, it's also expandable – definitely a high performance XT.

Commodore PC 40 III
_ The high specification AT compatible, for the power user, delivers exceptional performance in a small footprint.

Caring for your Commodore

YOU'VE PAID DEARLY for your treasured home computer, here's how to keep it looking good and working well. With a little extra care, your Commodore 64 should give you many years of faithful service. We still have a few old C64s plugging away here at the office. Of the ones that haven't shorted out when one of our writers spilt coffee on the keyboard, they all work great.

There's a few basic areas to watch out for that will protect your computer and the information on it from damage. There's no need to be fanatical about these things, but it does help to keep a watchful eye on problem areas around your setup.

Static

● Have you ever walked through a building with synthetic carpet and a dry air conditioned atmosphere? Often you'll receive a nasty 'bite' as you reach for the door handle on the way out. Try the same thing in low lighting and you'll be amazed at how big a spark can be generated.

A similarly sized 'bite' can ruin disks of information, send your C64 into a state of no return, or just glitch memory enough to damage some of your work. Anything magnetic is a likely candidate!

Static electricity is caused by a surplus or deficit of electrons on a charged body. Problems occur when the body in question is yours.

Normally any static charge you build up is slowly dissipated into the atmosphere or lost to an earthed object upon contact. The dryer the air, the longer a static charge will remain upon you.

Solutions

● Ensure that you are at the same potential as your computer before you touch any part of it. Or simply put, that you're on mutual ground. For example, touch the metal cabinet of your video monitor or some other earthed object such as the kitchen sink. Avoid picking up the static charge in the first place.

Static electricity is generated when two different materials are rubbed togeth-

er. Shoe soles on carpet, trousers across upholstery, plastic rubbed with silk are examples.

Instal your computer in an area with vinyl or wood flooring. Avoid carpet (particularly synthetic) like the plague. Carpet treatment chemicals are available for static reduction.

But seriously folks, on the whole C64s are pretty good when it comes to static. So unless you're in a particularly charged atmosphere, don't give it a second thought.

Dust

● The cleaner's nightmare. It gets on and into everything, keyboards included. Switch contacts don't like it. There isn't a lot you can do about this one other than cover your computer when it's not in use and keep it in a relatively dust free environment.

Covers are available from most computer retail outlets for popular home computers. If you're having trouble finding one to fit your brand, contact Computermate on (02) 457 8518.

Smoke is also in the danger category. A smoke particle is about one quarter the size of a typical dust particle. Of similar size is the fingerprint left when the magnetic surface is touched by human fingers.

A human hair, dust particle, or other foreign object can render a portion of a disk unreadable.

Other types of stray matter such as food should be kept well away from your keyboard. A few odd crumbs under key switches can render vital keys useless. Don't be afraid to vacuum your keyboard every so often to remove extra build-up from poor eating habits.

If all else fails, keyboards can be easily cleaned. Take your time dismantling them, there are a lot of screws. Wipe with a damp cloth, and spray PCB cleaner or anti-dust/static spray.

Disks

● As a general guide, do not expose floppy disks to the following: heat, magnetic fields, bending or other physical violence, dust, and greasy fingers. Avoid

touching the bare surface with your fingers. Sneezing on the same area is a definite no-no. Never use them as a coffee mat, or frisbee!

Disks become less reliable with use. Some sources suggest 25 to 30 hours of actual rotation. Keep backups and relegate heavily used disks to non-vital jobs after they have shown you long and faithful service.

Disks do shrink and expand slightly with the rise and fall of the temperature. Don't use a disk that has recently been roasting in the hot sun. Allow it to cool down to room temperature first.

Heat with the disk drive may cause inconsistencies. Make sure it is well ventilated, with easy air flow around the cabinet. In some instances it may be necessary to install a fan. Dick Smith stores sell a unit which is well suited to the job.

If a disk becomes swamped in coffee or beer, don't panic! If the data is vital you may still be able to get it back. Remove the disk from its casing, and allow to dry naturally. Avoid touching the surface - hold by its edges.

When everything returns to normal, replace in a new cover, and give it a whirl. You may be surprised just how much you recover. Don't be impatient though - wait until it is thoroughly dry.

Heat

● Your computer consumes electricity. Due to the laws of thermodynamics, this electrical energy is turned into heat. Energy can't be destroyed or created. It may only be transformed from one form to another.

Some silicon chips produce more heat than others. The VIC-II chip and ROMS are the worst off - especially if you have memory expansion, extra cartridges or a printer interface. Constant heat and cold can cause chips to become unseated. Just give them a firm press until you hear them click into place. They're pretty robust, so don't be to afraid too give them a firm push.

Don't impede the air flow to the computer's already small ventilation holes. Always put the machine on a hard flat surface, never on a blanket or thick table

Let's play games

An introduction to computer games

by Phil Campbell

Games, games, games. When you've got a Commodore 64, games make the world go round.

YOU MAY NOT LIKE to admit it. After all, you can use a Commodore 64 for a lot of very serious reasons. For wordprocessing. For working out the family budget. For educating the kids. Those are all good reasons - but they're mainly excuses. I'm convinced that the real reason people buy computers is so they can play games. Watch them next time you're in a computer shop - the yuppie dads buying computers "for their kids." They come in wearing their business suits. They try to look serious. But all the time, they are casting furtive glances at the games.

Well, guys and gals, mums and dads - now is the time to come out of the closet. Now is the time to stand tall. Admit it. Computer games are great.

And you love 'em. If you've got a Commodore 64, you've got the most impressive selection of games in the world to choose from. Nothing can compete with the range of games available for what is still the most popular home computer on the planet. So make the most of it!

Besides, computer games are useful. First, they're relaxing. Unwind, take that load off your mind, and blast a few thousand aliens. Excellent therapy, and cheaper than seeing a shrink.

Secondly, games are the best way to introduce people to computers. Computer games make kids curious. Curious about how the computer actually works. Have a look at our selection of hints and tips. Some of these involve actually modifying game programs with the basic POKE command - a great start if you've got an inquisitive mind. "How does it work" is the age old question. Start with a few POKEs here and there, and next thing you know you'll be writing your own programs.

The supply of new games for the Commodore 64 has slowed down a little in the last year. Software houses have decided that the Amiga is the way to go - strangely, they are also pouring money into developing games for the boring old IBM. Sometimes I think the quality of new games is dropping a little too - even when a game is released in multiple formats, the C-64 version is often cobbled together as an after-thought.

On a brighter note, the year gone by has seen some excellent entertainment software. It seems to me that the C-64 still has the best range of high speed shoot-'em-ups. Often Amiga games look pretty, but they don't play nearly as well as their C-64 counterparts. Turn the page and you'll find Luke Lynde's detailed rundown of seven of his all time favourites. You'll also find a comparison of three of the best game controllers - they say a bad workman always blames his tools, but the fact remains that a good joystick will make a lot of difference to your personal high score chart.

There's plenty more happening, so sit back and relax - browse through the next few pages for an introduction to the world of entertainment. After all, we all like games. Even if you don't like to admit it. ❑

Poke-ing Fun

● A PILE OF HANDY hints and tips to get you through your favourite games. Ever get frustrated when you can't make it past the first stage of that game you spent your life savings on? It doesn't seem fair, does it. After all, there are fifteen more stages to explore, with bigger, brighter and better alien landscapes and enemy spaceships. Suffer no more. Here's a selection of our best hints and tips, little tricks that will make you look like an expert at even the hardest games.

How do they work? Well, some rely on secret passwords left in the program by the authors - they are used during the development of the game to let the programmers check all the features without having to worry about getting blasted out of the sky. Others let you modify the program by directly changing various memory locations with the POKE command. Sometimes you can disable Sprite Collision Detection. Or maybe change the memory location that tells the program how many "lives" you've got. Or perhaps you might like to increase the game time by extending the value in the memory address that sets the timer.

You'll notice that hints like these ask you to RESET the computer. Obviously, you can't use the POKE command built into your computer while a game is running. First, you have to load the game into the memory of your computer. Then you have to stop it so you can fiddle around with its program code. But how? You can press the STOP and RESTORE keys as long as you like, but nothing will happen.

What you need is a special RESET BUTTON - there are a number of different types available, some built into fancy cartridges, others that simply plug in to your serial port. Try your local computer shop, or look through your back issues of *Australian Commodore and Amiga Review* for information on how to build one. It's

really very simple.

I shouldn't tell you this, but you can also reset your computer by shorting together pins 2 and 6 of your serial cable with a paper clip or other suitable device. DON'T BLAME ME if you try this and blow up half the chips in your computer!

My system has survived OK, and I've been doing it for years - others have not been quite so lucky. When you reset the computer - a "cold start" - you will be presented with the standard startup screen, as if you have just switched on. But never fear - your game program is still tucked away safely in memory, all ready to be modified by your POKE commands and restarted with "SYS".

That's it folks. So go for it. POKE to your heart's content, and then go exploring those impossible levels that have never before been seen by human eyes. ❑

Ace II
● Enter DUSTY BUG on the high score table to become indestructable.

Beyond The Ice Palace
● Reset the computer, then POKE 5918, 173 Return] for infinite lives
● POKE 17820, 173 Return] to disable sprite collision Restart with SYS 2062

Bombjack
● For an invincible Jack, reset then POKE 5112,0 - restart with SYS 3101.

Brainstorm
● POKE 18281,173 then SYS 16384 for infinite lives.

Chubby Gristle
● POKE 3613,173 then SYS 2994 for infinite lives.

Gauntlet
● POKE 49004, 96 then SYS 32768 to restart with infinite lives.

Ghostbusters
● When you are asked for your name, type OWEN. For your account, type LIST. This will give you plenty of spending money.

Giana Sisters
● Hold down the A R M and N keys to advance a level.

Hoppin Mad
● POKE 24447, 165 for infinite lives
● POKE 22797, 165 for infinite time
● SYS 20480 to restart

IO
● First, load the program and reset the computer. Then;
● POKE 25117, 173 for infinite lives
● POKE 24969 with a number between 0 and 3 to set the starting level
● POKE 27026, 0: POKE 27027, 173 to make your ship invincible
● POKE 25080, 173 lets you keep the firepower you've earned, even if your ship gets destroyed.

● To restart the game, type SYS 24576 followed by RETURN.

Kung-fu Master
● Load the game, then reset. Enter POKE 34142, 128 followed by RETURN, then type SYS 32768 to restart the game. You now have endless lives.

Lazy Jones
● Reset after loading, then enter POKE 4063, 173 followed by SYS 2061 to restart with infinite lives.

Manty On The Run
● The password sequence for this game is as follows - ROPE-JETPACK-PASSPORT-GASMASK AND THE BOTTLE OF RUM

Mutants
● Reset, then POKE 9273,230 for infinite lives SYS 4096 to restart

Nemesis
● Press shift-lock and then the space bar 4 times to activate cheat mode.

Netherworld
● You'll need the *Replay Cartridge* to use restart this one -
● POKE 12116, 44 for infinite lives
● POKE 8138, 0 for unlimited energy
Otherwise, try pressing 2, 4 and E all at once to enter the next pattern.

Operation Wolf
● Do all the usual stuff, then POKE 33351, 165 for infinite energy. Restart with SYS 16963.

Outrun
● POKE 44049, 96 to stop all collisions
● POKE 34686, 173 for infinite time
● SYS 38045 to restart

Pacmania
● Load and reset, then POKE 28520, 165 for infinite lives. SYS 14336 to resume.

R-type
● When fighting the first guardian, if it approaches with its TAIL DOWN, hold down the fire button and it will pass right through you!
Or if you prefer to make some changes
...
● POKE 12865,173 then POKE 12957,173 for infinite lives
● POKE 12700,96 to disable sprite collisions
● SYS 32768 to restart

Rygar
● Load the game, press reset, then enter the following -
● POKE 9551,165: POKE 4050,77: POKE 4055,77
● Press RETURN, then restart the game by typing SYS 2325. You now have unlimited lives.

Scooby Doo
● POKE 7459,96 then SYS 2560 for infinite lives.

Space Harrier
● POKE 5884, 96 for infinite times
● POKE 6010, 173 for infinite lives
● POKE 14212,234 for the fastest 3-D ever
● POKE 14631,127 to slow it down
● SYS 2128 to restart

Thing Bounces Back
● On the title screen, type Y J O M H for infinite lives.

Thunder Blade
● Load and reset, then POKE 4159 with a value between 3 and 255 for the number of lives you want - eg. POKE 4159, 100 will give you 100 lives. Then SYS 4096 to restart the game.

Tiger Road
● For infinite Ninjas POKE 5749, 165, then SYS 14848 to restart.

To Hell and Back
● POKE 32371,173 then SYS 30464 for infinite lives.

Traz
● Reset, then POKE 42200, 173 and SYS 327687 - you will now have infinite balls.

Vindicator
● Load and Reset, then POKE 34644 with the number of lives you'd like - anything between 3 and 128. Sys 34480 to re-

start the game.

Drowning in a sea of games? There are so many to choose from, especially when it comes to the ever popular shoot-'em-up. Here's help - Luke Lynde sorts out seven of the best in our ...

Ultimate "Shoot-em-up" Guide

● Blasting aliens is a lot of fun. You can do it in all sorts of directions. Left to right. Horizontally. Vertically. It doesn't matter, just so long as the action is fast and furious and there are plenty of bad guys to blow to bits.

Around a decade ago, a game called *Space Invaders* hit the arcades and caused quite a stir. It was soon a house-hold

name. This game was the first shoot-em-up ever to appear, and now there are virtually thousands. *Space Invaders* has gone from 'State of the Art' to 'Prehistoric', because nowadays it's just too repetitive and boring.

An essential ingredient for a shoot-'em-up is a change of scenery for each new level or section, and this is what

Space Invaders sadly lacked. Also as a must for any shoot-'em-up is good playability (meaning - feel, control, speed and level of difficulty). Mind you, *Space Invaders* had plenty of this - that's why so many kids used up all their pocket money in the game arcades.

Graphics and sound also play a key role, but a game with virtually no playability would be disastrous. *Dropzone* (reviewed below) is truly a classic game because of its playability. Graphics and sound are merely average but they don't affect its addictiveness at all!

There are also many absolutely shocking shoot-'em-ups around; one example is the unforgettable game *Side Arms*. Avoid it if you see it! I've reviewed seven

NEW PC30 FROM GERMANY

GREAT VALUE!

COMMODORE ANNOUNCES THE BEST VALUE BUSINESS COMPUTER EVER!

Commodore, the world's largest supplier of computers, introduces the new PC30-III 80286 PC(AT).

Designed to keep small business in business. Because the new German made Commodore has full business capabilities, without a business price.

The new German made Commodore PC30-III caters for business applications such as • Spread Sheets • Accounting Software • Data Base • Word Processing.
The Commodore PC30-III is of course fully MS DOS compatible. It's also the ideal system for existing PCXT users who need better performance from their 8088 system without outlaying a small fortune to achieve 80286 features.

The new Commodore PC30-III gives you everything you'd expect from an international computer company like Commodore. It is not a Taiwanese clone.

Commodore

Armalyte

shoot-'em-ups in this guide, all detailed and explained with a rating out of 100% for each. All of these are of strikingly high quality and should be purchased when seen.

Let's get on with the games...

Armalyte 96%

● *Armalyte*, from English software house Thalamus, has two predecessors - *Sanxion* and *Delta*. Neither are quite as good as *Armalyte*, but that's not saying that they're bad. On the contrary, they're definitely worth getting your hands on if you see them. *Armalyte* is a mixture of the above two games, and is purely excellent.

It is set in a high tech space craft with your mission being to make your way through the eight lengthy Horizontal Scrolling levels of Hsiffian defences. These Hsiffian defences comprise hostile aliens and enemy crafts of all shapes and sizes, all of which are out for your early departure. They obviously also must be

all killed in order to reach the next level.

Each level ends with Giant Aliens which must be shot quite a few times to be killed, proving quite a challenge and a sense of achievement when they have finally been destroyed. Extra weaponry is gained by shooting crystal (which are scattered all around the landscapes) and then picking them up.

Some crystals give you limited invulnerability and some give you side mounted lasers - the weaponry is better the more shots the crystals have undergone.

Armalyte has been given nicknames like 'Delta 2', and even 'Sanxion 3' - they are well deserved! Unbelievable graphics (noticeable in all Thalamus software), sound, playability, and stunning end of level aliens make *Armalyte* one of the best shoot-'em-ups ever to appear. An essential purchase for such high quality.

Hawkeye 97%

● Another classic shoot-'em-up from the people at Thalamus, not at all like *Armalyte*, but still one heck of a game. Keep it up, Thalamus, you could easily end up being the best software house around. Now it's on with the review...

Planet Xamox had finally reached perfection on their planet when they were suddenly destroyed by a tribe of Milky Way Nomads called the 'Skryksis'.

The Skryksis began building radiation plants on the Xamox surface, forcing the few survivors of the once flourishing Xamox people underground. The atmos-

phere above was poisoned, thus making the planet impossible to live on.

The angry survivors quickly made a half robot and half human called the SLF (Synthetic Life Form). You take control of this SLF and must traverse numerous bi-directional horizontally scrolling levels, shooting all the hideous creatures lurking about, in order to shut down the Radiation Plants.

To pass through each of the 12 levels, you must collect four 'Puzzle Pieces' in the shape of icons and then make your way to the end of the level where bonus points will be added to your current score. You will also then be recharged ready to go on to the next level.

Other icons can be collected other than the Puzzle Pieces, and can replenish lost energy and top up your ammunition supply. You have a total of four weapons ranging from the pistol to the pulse laser, but these are in limited supply, so shoot carefully.

Radiation Plants will be shut down and the planet Xamox will be returned to its former glory. "Yay! What a hero! Perhaps you can do it again for us the next time we're in trouble," they say. "Only with a copy of *Hawkeye* handy," you reply and then there is deep silence as this review comes to an end.
Wha'ts so good about this game is the neat control of the SLF, with the superlative graphics and sound enhancing the already absorbing gameplay. Nuff said.

Dropzone 97%

● From ace programmer Archer Maclean (maker of *International Karate* also!) comes a classic shoot-'em-up named *Dropzone*. *Dropzone* is a bi-directional horizontally scrolling game in the vein of the old arcade classic called *Defender* (anyone remember that?!). With a jetpack on your back and a rapid fire laser, you are set off to patrol the skies of the Jovian Moon, Io (no relation to the game of the same name.)

There you are on the lookout for stranded scientists who must be picked up and placed on a 'Dropzone', found in the middle area of Io. When all of the scientists are collected and safely placed on the Dropzone, it's on to a new and even harder level ... it's not as easy as it sounds as there are lots of aliens on each level set out to destroy both you and the scientists that you are trying to collect.

These aliens can be killed with your laser or smartly avoided by using the spe-

Hawkeye

Armalyte

shoot-'em-ups in this guide, all detailed and explained with a rating out of 100% for each. All of these are of strikingly high quality and should be purchased when seen.

Let's get on with the games...

Armalyte 96%

● *Armalyte*, from English software house Thalamus, has two predecessors - *Sanxion* and *Delta*. Neither are quite as good as *Armalyte*, but that's not saying that they're bad. On the contrary, they're definitely worth getting your hands on if you see them. *Armalyte* is a mixture of the above two games, and is purely excellent.

Dropzone 97%

● From ace programmer Archer Maclean (maker of *International Karate* also!) comes a classic shoot-'em-up named *Dropzone*. *Dropzone* is a bi-directional horizontally scrolling game in the vein of the old arcade classic called *Defender* (anyone remember that?!). With a jetpack on your back and a rapid fire laser, you are set off to patrol the skies of the Jovian Moon, Io (no relation to the game of the same name.)

There you are on the lookout for stranded scientists who must be picked up and placed on a 'Dropzone', found in the middle area of Io. When all of the scientists are collected and safely placed on the Dropzone, it's on to a new and even harder level ... it's not as easy as it sounds as there are lots of aliens on each level set out to destroy both you and the scientists that you are trying to collect.

These aliens can be killed with your laser or smartly avoided by using the spe-

Hawkeye

cial 'Cloaking' feature where no sprite collision is detected. This feature only lasts for a limited time though, and should only really be used when in desperate trouble.

If all the scientists are captured and destroyed before you have a chance to collect them, lava spurts up from the Moon's many volcanoes and frantic blasting becomes the order of the day, very hard indeed when that happens. Control of your Man in this game is truly superb, and this game shows you that without really good graphics and sound you can still have an immensely playable and addictive game. The more this game ages, the better it gets!.

Cybernoid II 92%

● The sequel to *Cybernoid*, *Cybernoid* is nearly as good and if possible, you should try getting both of them. They're recommended games for any shooter's collection! Now, about *Cybernoid 2*...

Pirates have been causing chaos around the planet and all of this must be stopped once and for all. The Federation have asked you, Mr Mega Hard Man, to stop these pirate thugs before devastation occurs. This is done by flying your space craft around the four flick-screen style levels and shooting absolutely everything that gets in your way.

This is not at all simple (is it ever?) because you have to use the various weapons at your disposal at the right time and place, in order to tackle the screen that you are on correctly. Cargo must also be collected (which falls off blasted pirate craft and is sometimes scattered around) to the value of 1500 points in order to go onto the next new level.

The best thing about this shoot-'em-up is that it also involves a bit of lateral thinking and some frantic blasting. The graphics are extremely well-defined and movement is great. A neat tune blasts throughout and heightens the atmosphere even more. What more could you ask for?!

Parallax 90%

● Ocean have been busy making
Cybernoid II

some great film tie-ins, namely *Robocop* and *Batman*, but two and a half years ago they made a shoot-'em-up called *Parallax*. That's quite a while ago, but *Parallax* hasn't mellowed with age and still impresses as much as it did then. *Parallax* is over two years old and is better than about 65% of the games released today.

Enough of this, let's talk about the game. *Parallax* places you in a craft called the 'IBIS' where the objective of the game is to find a total of five passwords and rescue your friends. This is done by flying around the all-directional scrolling levels, landing on special Landing Pads which are scattered around the landscapes, and drugging Scientists. "Drugging scientists?" you think. How is it done? Well ...

After you land on a Landing Pad, you can walk about the surface and into special rooms (known as Hangars) where you may find a scientist. Make sure you select enough oxygen before you leave the ship. You can get handy info out of scientists when you drug them with your special home-brand narcotics.

When you have the password, you must go to the level's Central Computer

(yet another type of Hangar) and if the password you entered is correct, then it's on to the next level.

After getting through the five levels you will have rescued your five astronaut chums and sucessfully completed your mission. This game is a special blend of strategy and action and is adorned with great graphics, surreal sound and really good scrolling. You could get a lot worse a game than this, so buy it!!
Paradroid 98%

● Before I tell you about this excellent game, I must give high praise to the programmer Andrew Braybrook for such an excellent job. Andrew programmed this game in a mere four months (May to August 1985) and it is without doubt the most superlative shoot-'em-up ever. Andrew has produced other high class games such as *Uridium*, *Morpheus* and the more recent *Intensity*. All of which are very good - but not as good as this. Read on and see why.

A group of ships are on their way to the Beta Ceti System when all of a sudden disaster strikes. The group of ships ran into a field of asteroids killing all of the
Parallax

Paradroid

human inhabitants on board and scrambling all of the robot droids' circuitry, rendering them hyperactive and dangerous. And to make things worse, all three ships are heading for Enemy Space, and if in enemy hands, could destroy life on earth as we know it.

A prototype droid known as the 'Influence Device' has been beamed aboard the first ship called the *Paradroid*, and the droid's objective (your objective!) is to clear the eight Robo Freighter ships of all menacing droids.

All the ships have many Deck Levels.

Some can be freely entered, others are a little more tricky. There are three ways to kill the other Droids. You can shoot them with your current Droid's built in laser armament, bump them off, or transfer into them.

Shooting them is a sensible way to go and bumping into them is a no-no because it can cause severe damage to your droid and you may even die.

Transferring into them is definitely the way to go, done by centring the Joystick, pressing the Fire Button and attaching yourself onto another droid. This puts you into 'Transfer Mode' and when you touch the other droid, you enter what is called a 'Transfer Game'. In the

Transfer Game, there are 12 wires on each side of the screen (your droids and the droid that you plan to take over) comprising of the colours Yellow and Purple. You then must pick a colour and with your joystick you must position pulses to be sent through the blocks of your opponent's colour.

You win if you can set seven of the 12 blocks to your own colour. If the bout is tied, a 'Deadlock' occurs and if you lose, you will be 'Burnt Out' and the game will end. If the Transfer Game is won by your droid, you are transferred from your current droid (the 001 on your first go) to the droid that you won the bout over. The droids in the game range from the 001 to the 999, there are 24 types.

After a long four years, I feel that no shoot-'em-up has bettered this. It's definitely the best shoot-'em-up around, no questions asked. Get it or regret it.

Wizball 89%

● Another masterpiece from Ocean, and here's how it goes ... Wizworld was once a beautiful planet, but the Evil Zark drained out all the colours 'til they were non-existent. As a wizard you must bring back the colour to the once luminescent Wizworld by collecting certain Paint Drops and mixing them together into the landscape's three target colours.

You, the Spherical Bouncing Wizard, are in a bi-directional horizontally scrolling world and travelling around Wizworld is done by bouncing yourself around and falling into vertical tunnels. Evil Zark's friends are out to get you too, so precise firing and control is an absolute essential! Icons can also be collected from Dead Aliens and add on various features to your Wizball.

There are eight exciting levels and all prove quite addictive and enthralling. There is great scrolling in this game and a very weird title tune. All of which makes this great game even better!

Conclusion:

● That's it, folks - my summary of the best Commodore 64 shoot-'em-ups of all time. Most titles are available through your local K-Mart, though keep an eye out in your local computer store. Some of the older titles may even be on special.

Armalyte can be obtained by writing to Thalamus at the following address: Thalamus, 1 Saturn House, Calleva Park, Aldermaston, Berkshire RG7 4QW. ❑

The joy of a good stick

Sick of the sound of breaking plastic? Tired of those flimsy joysticks that are "here today and gone tomorrow"? Phil Campbell reviews some top quality joysticks that are guaranteed to "stick around" ...

MY FIRST JOYSTICK died after just two weeks. It was obviously designed to self-destruct. With a flimsy plastic stick and paper-thin metallic switches, the only question was which would give way first.

The designer obviously did not realise that saving the world from *Space Invaders* can be quite an athletic business. In heated moments the humble game controller can suffer quite a battering.

Epyx 500 XJ

● At last, manufacturers are coming to grips with the problem. The new breed of sticks have set a high standard of durability, often backed by impressive warranties. The EPYX 500XJ, priced at $39.95, has a five year, 10 million shot guarantee.

This model, distributed by Questor (ph 02 697 8666), takes a unique design approach. "Ergonomic" may well be the most over-used adjective of the decade, but this stick certainly earns the label.

Shaped to fit neatly into the palm of an average sized hand, the unit is quite comfortable to hold. The fire button is set into the curved side of the casing, fitting neatly under your trigger finger. Other contours are provided in exactly the right place for the average thumb and the average middle finger - any extra digits should wind gracefully round the narrower stock of the casing. If you are average.

Your other hand is now free to control the movement of the stick, in this case a four centimetre steel shaft encased in moulded plastic. The compact size of the mechanism ensures a "shorter, faster and more precise throw, and a better feel."

Cruiser

● The Cruiser is another high quality contender in the computer "gear-stick" stakes. My test unit was supplied by the Computer Spot in Burwood (ph 02 744-8809), and retails for $49.95. The name is corny, the blue and red colour scheme is tasteless, and the styling can only be called "60s kitsch". On the box, the Cruiser is photographed floating above a mysterious planet - with strong hints of a scene from the "Thunderbirds". Fortunately, it performs better than it looks.

Adopting a different design philosophy to the hand held Epyx unit, the Cruiser has four high powered suction pads on its undercarriage. These plant the stick firmly on any smooth surface in front of your computer, and give a stable base for your alien blitzkreig.

The unit also features a "Variable Tension Control Ring" - a collar around the shaft which adjusts the degree of movement required to activate the internal mechanism.

Both joysticks use micro-switches, giving precise control and a satisfying "click" on each activation. In play, however, they have remarkably different characteristics.

I tested both models in battle conditions. Playing *Insanity . Fight*, a high-powered and fast moving space shootout, my average score with the Epyx 500XJ was 12,260 points. With the Cruiser, I scored an average 24,325 - a dramatic 98.4% increase. In a game like this, the fire-button is the most important control of all - and the Cruiser can pump out almost twice as many shots per minute as the Epyx. The button on the Cruiser is delightfully responsive.

On games that required fine directional control with the joystick, the reverse was true. Playing *Tetris*, for example - a game where you have to neatly stack falling shapes - the Epyx came out on top. Movements were precise and accurate - a liability if you panic, but a great asset otherwise.

Both the Epyx and the Cruiser are impressive joysticks - they will probably last considerably more than two weeks. On the other hand, with switches guaranteed for 10 million activations and a firing rate of 500 shots per minute, you could find your joystick worn out after only 13.9 days of continuous play. But addiction like that is a serious problem.

Challenger remote control

● The Challenger remote control joystick features an infra red remote control link. Now you can fight off the alien hordes while you sit back in an arm chair, while you stroll around the room, or even while you eat dinner - in fact, providing you can still see what's happening on the screen, you can control your games from anywhere in a five metre radius.

This is a great idea. After all, we've been controlling our Video Recorders and TV sets this way for years. Remember when you used to trip over those endless, tangled remote control leads that snaked across the loungeroom floor? Those days have long gone - and good riddance.

The Challenger comes in two parts - a small, mouse-shaped receiver unit that plugs into the normal joystick port of my Amiga, and a fairly ordinary looking main joystick. The receiver sits on top of my monitor, with a flashing red light emitting diode on the top, and a black plastic infra-red filter on the front.

The joystick has a similar black filter set into the front of its base. Naturally enough, if your hand slips over it, the game you are playing will come to a premature end. In practice, this is rarely a problem.

The handle of the joystick is comfortable to hold, and there are two fire buttons - one located under the thumb, the other under the index finger.

The unit is solidly constructed, with a solid plastic casing, six positive click-action switches and a nice overall feel. Three small batteries fit into the bottom of the unit.

The Challenger works extremely well. Control is instant and direct - in fact, there is nothing unusual about the joystick performance at all. I clocked my usual scores on most games, though I suspect that the auto-fire option is a little slower than on my usual stick. Who cares? Now that I'm free from the tangle of cables around my computer, nothing else matters.

Distributed in Australia by H&R Wholesale Pty Ltd (ph 02 897 1044), the Challenger remote control joystick has a recommended retail price of $59.95, only a fraction more expensive than a standard stick. A small price to pay for freedom. ❑

Basic sorting data

by David Williams

Every programmer of any type of computer will eventually have to sort some sort of list, whether addresses, or high-scores. There are many types of sorting routines. This article will cover several types: push-down, ripple, and Shell sorts, and also chaining.

● **Push-down** sorting is where the data is automatically ordered, while being entered. This means that a value is entered, and the computer quickly searches through the list, making comparisons to find where the new value belongs. When its place is found, the data after it in the list is pushed-down (hence the name) so as to accommodate it.

```
10 dim a(100):e=.
20 input"data";d:if d=-1then 90
30 if e>.then 50
40 e=e+1:a(e)=d:goto 20
50 for i=1to e:if a(i)>dthen 70
60 next:goto 40
70 for j=eto istep -1:a(j+1)=a(j):next
80 a(i)=d:e=e+1:goto 20
90 for i=1to e:print a(i):next
```

This example first defines an array of 101 elements (as the first element is number zero, however we do not use it, and so only 100 are relevent.) and sets the variable e to zero. This shall hold the number of data elements. In line 20, the user is asked to enter some data. If -1 is entered, the program will print the list and end. Otherwise, in line 30 a test is made to see if this is the first entry. If so, e is incremented, and the data put in the list, and line 20 is jumped to.

If not, a search is made from the beginning of the list to find where the data belongs, and then in line 70 all the elements in the list after this position are pushed down. The data is put in its place, e is incremented, and line 20 is gone to.

The problem with this is that it slows the computer down quite noticably after many elements have been entered.

● The ripple-sort is probably the best known, and is also known as a bubble sort. This works by comparing consecutive elements, and swapping them is necessary. Thus after one sweep through the list, the last element is in the right place, but all the others are probably not. The sweep is then made again, but one less comparison needs to be made, for the above reason. This is then repeated until one comparison is made. This routine is adequate for short lists, but is far too slow for massive ones. One reason for this is the number of comparisons made. This can be calculated by the formula:

Length of list * length of list -1 / 2

So for a list of 100 elements, 100*99/2 comparisons need to be made, which is 4950. A way to shorten this is to insert a variable that adds the number of comparisons made in a sweep. If this comes to be zero, then the list must be in order, and so the routine can end.

● **The Shell sort** (named after Donald Shell) is a much quicker alternative. This uses a gap, which is initialised to half the items in the list.

For instance in a list of 100 elements, the gap is set to 50. Now, instead of comparing neighbouring elements, comparisons are made between elements that are seperated by this gap. For example, if we had the array a(x) with 100 elements, a (1) would be compared with a(51), a(2) with a(52) and so on. When no more swaps can be made, the gap is halved, and rounded down, so it goes 50, 25, 12, 6, 3, 1. In the ripple sort a value is moved down the list one place at a time. In the Shell sort it is moved 50 places after the first comparison.

Doubling the size of a list quadruples the time taken for a ripple sort, but only increases a Shell sort by a factor of about 2.7.

● Another method is **chaining**. This removes the need to make great amounts of swaps, by having another list, containing 'amendments' to the order of the main list. That is, each item in the list 'points' to the next item.

Say we have the array a(5,2). We have the list 1, 2, 3, and 4, which is:

a(1,1) = 1a(2,1) = 2a(3,1) = 3a(4,1) = 4

The fifth element is not yet defined. Now, the next list goes as follows:

a(1,2)=2a(2,2)=3a(3,2)=4a(4,2)=-1

These numbers point to the next part of the list. The -1 is to show that the list ends there. Our array is therefore set up as:a(x,1) = data itema(x,2) = next value of x in the list.

To print this, we would use the following:

```
10 i=1
20 print a(i,1)
30 i=a(i,2)
40 if i>0then 20
```

Okay, now how to add items. This is where the main speed advantage is.

We only have to stick the data on the end of the list, and then find the element that goes just before it, numerically or alphabetically or whatever. We change its pointer to our new addition, and set this pointer to what the previous element was just pointing to.Say our list is now 1, 1.5, 2, 3 and 4. We already have:

a(1,1) = 1	a(1,2) = 2
a(2,1) = 2	a(2,2) = 3
a(3,1) = 3	a(3,2) = 4
a(4,1) = 4	a(4,2) = -1
a(5,1) = 0	a(5,2) = 0

and so we have to make the following changes:

```
a(5,1)=1.5
a(1,2)=5
a(5,2)=2
```

This is a very easy method to use. It is most effective when used like push-down sorting, that is, during the data entry process. After a value is entered, a quick search should be made through the list and the value added, and the pointers adjusted.

These are just suggestions to get you started. The best sorting routines are those written in assembly language, however these generally impose a number of restrictions on the user, which BASIC's flexibility doesn't. ❏

Calendars :- An improved program to produce a calender for any year.
Cheque Writer :- Fill in the details and print a professional looking cheque on the Westpac standard small size cheque
Clock :- A special clock which is displayed in the border.
Future Writer :- A full blown hackers word processor for sending musical messages using a variety of type faces.

Disk Magazine 9 $12

Disk Tidier :- Enables you to modify the order of your directory listing.
Menu Maker :- A simple boot loader for the front end of your own disks.
Doctor 64 :- Is your computer looking a little off color? This program passes a test through all the main devices selectable from a icon driven menu.
Sprites in the Border :- From our December 1987 issue demonstrating how to use sprites in the border this program enables you to edit your own message and display it scrolling in the border.
Sprite Clock :- The complete clock in the border program by Andrew Baines.
Metric Converter :- 22 conversions from Imperial to Metric and reverse.
Stock Market :- An educational game.
Star Trek :- For all Trekkie fans here is an originat version of that famous game.
Little Invoicer :- As appearing in the December 1987 edition this program enables you to run a basic invoicing system.
Demonstrations Alf, The Trap Demo, Future Shock, Pure Genius, DNA, XESS 1 Rendezvous, FTL Demo, Weird One II, Taurus II, Real Real Thing, Sights and Sound, Crazy Sample I, Brick Wall, Incredible, Drive Music, Get Funky.

Disk Magazine 10 $12.95

- Features ADOS Menu System
Diary - Version One of our Appointment Manager System. Both the compiled and BASIC version are included.
Depreciation :- Educational program for demonstrating and calculating the process of depreciation using three commonly used methods.
Define Function Keys :- Yet another function key definition program. This one is particularly easy to use.
Hamlet :- A good version of the popular game Othello.
Cup Challenge :- A two player only using two joysticks sailing simulation.
Star Gunner :- Shoot'em up perspective view.
Chemistry :- Features the chemical symbols of the periodic table. Ideal for year 8 and 9 students.
Music :- A full featured music editing program written in compiled BASIC.
Print Sheet Music :- Enables you to print out sheet music on your printer in case you run out of the real stuff.
Slide Show :- A brief selection of impressive graphics.
Demonstrations : Amiga Memories, Beyond 2, Border Screen, Hero, Knight Games Music, Madonna Demo, The Working 64, Watch the Eye, ESCOS I, ESCOS with Music, Sting, Bairds Tale.

Disk Magazine 11 $12.95

80 Characters :- A special driver enabling the display of 80 columns of text. Useful for your own BASIC programs.
Graphic Converter :- Transfer pictures between a variety of formats.
Line Number Deleter :- Allows you to perform block deletes from BASIC.
Function Keys :- Here is yet another function key program.
System Locater :- Helps you find the SYS call to start a machine language program.
Fixed Directory :- Will reconstruct some disk corruption problems.
Disk Searcher :- Just enter the text that you are looking for and this program will try to locate it on your disk.
Disk Tidier :- Batch program deletion.
1541 Drive Alignment :- A quick utility which promises to align your disk drive - untested.
Disk Doctor :- Another program for reconstructing corrupt disks.
Hi-res Jigsaw :- This fun program lets you pick a picture and then it rearranges it into small blocks. Use the joystick to try and reconstruct the image.
Equation Manipulation :- Teaches the rules of equation manipulation. Helpful drill section.
Linear Equations :- Teaching and drill educational program.
Probability Demonstration
Printer Drivers :- Side Two of this disk contains a long list of printer drivers for GEOS including the 1526/ MPS 802 and many others.

Disk Magazine 12 $12.95

Appointment Manager V1.2 :- Updated from Issue Ten, now with search and print options.
Third Term 1.0 :- A fully menu driven terminal program.
Panes :- Based on the July Issue, 1988 of ACR, this program allows you to produce simple windows and menus. Written by Andrew Baines.
Atlantis :- A fast shoot'em up where you are a fish underwater. Excellent graphics, lots of levels.
Circle Navigation :- Calculates the distance between any two points on the globe.
Slope and Intercept :- Teaches the formulae involved for working out gradient, x and y intercepts. Full instructions included.
Music :- A selection of three music compositions by Eric Holroyd which you may include in your own programs.
GEOS Upgrade :- Side two contains a number of files which you should copy to a GEOS disk in order to upgrade to Version 1.3
Educational Programs : Portfolio, Balance, Investment, Bonds All have built-in instructions.
Time Crystal :- An interactive graphic demonstration by Jim Sachs. One of the masters of Commodore 64's graphic capabilities. This was the beginnings of a game which he never completed.

Disk Magazine 13 $12.95

Charles - a huge graphics adventure with animation. You are Charles and must locate the missing computer and return it. Joystick control enables you to travel over 390 screens during five levels. It maintains high scores.
Stowaway - a text adventure by Base Seven Software. You are a stowaway on a ship - can you escape?
Blackjack - Play the computer at this favourite card game.
VCR Index - keep a file of all your favourite video cassette recordings, tapes or records.
Graphic Converter - An invaluable utility that enables you to transfer clip art type graphics from Printshop, Printmaster, Stop Press and even future programs to other formats. You can also convert between various picture types such as Blazing Saddles, Koala Painter, Art Studio, Image System, Artist 64 and others..
Disk Diskassy - The best disk utility ever written for the C64. It's in full machine code and includes a BAM editor, Directory Editor, Sector Editor, Index Maker and Menu Creator. All menu driven, very easy to use. Ideal for programmer and hobbyist.
Disk Label Maker - Print one or two sided labels complete with a directory of what's on the disk or customise your own entries to either an Epson FX or MPS801/803 printer.
Icon Changer (GEOS) - This program will let you edit them to your own design.
Easy DOS - A quick little program for obtaining a directory, scratching or unscratching files, renaming programs or changing your disk header.
Cruncher BASIC - Pushed for memory? This program will in seven parcels compact your program as much as possible by compounding statements onto one line.
Calc - A simplistic spreadsheet type program which is currently tape based but may be modified to save data to your disk drive.
Font Diskassy - A character editor that also lets you create pictures by combining characters together.
Graphic Demonstrations - A selection of pictures and music from hackers and artists around the world.
PLUS various other short utilities and fun programs.

Disk Magazine 14 $12.95

Electronic Cad Package - Design electronic circuits using two sets of predefined component symbols, alternatively define your own symbols. Use for any architectural or planning application.
Software Cataloguer - Keep track of all your favourite programs, which disk they are on and the type of file. Sorts and prints.
Character Thief - Extract redefined character sets from commercial games for your own personal use.
Pointer C64 - Give your C64 an Amiga pointer. This amazing function is accessible from BASIC with examples of use included.
Best single disk file copier - An easy to use program for moving files around your disk. Collection allows wild cards format from program and multiple copies.
Never ending scroll - Edit and design your own message scrolling across the screen in a variety of colours with optional flashing and at whatever speed you require. Saves to a machine code program which can be run. Works from IRQ.
SEQ file reader - Enables you to view sequential files such as those produced by Easy Script on screen.
CompuPage - A fun game for up to four players. Based on the popular board game Pay Day. And lots of demos.

The Commodore Annual 1990
Software Guide
including hardware, joysticks, cartridges

SOFTWARE AVAILABILITY IS always a sore point with computer owners. Well, here's a list of all the titles we found available in Australia. Your local computer store should be able to order in the product you're after. A code for the distributor or importer is listed with each program along with the current recommended retail price. Prices often change from store to store - and as new versions of products are released.

Your dealer can contact the distributors using the details at the end of the listing. Distributors are often helpful too if you require further product information which your dealer cannot help you with.

We have not listed any games titles im this Software Guide - there are so many. But there is a list of games on page 62 with distributorr and in most cases prices.

Recommended retail prices and availability are based on information supplied by those distributors who responded to our enquiries. The distributor listed is not necessarily the only or the exclusive distributor of that product. ❏

Landmark
Full reference bible. King James Version. 31 disks.
CMT 189.00

LCL Micro Maths
Advanced maths program. Year 9 - 11.
PAC 49.95

Learning to Count
Introductory maths program to help children to identify numbers, groups and objects. Ages Grade Pre- School - 1.
PAC 19.95

Letters for You
Learn about the alphabet using pictures. Colour them in on the computer, or print them out and colour them in yourself. Preschool and up.
DFL 21.95

Mastertype Writers Bundle

# IF YOU'VE BEEN CLEVER ENOUGH TO BUY THE WORLD'S SMARTEST COMPUTER, JOIN THE CLUB.

By choosing an Amiga, you've already put yourself one step ahead of the average computer owner.

Because the Amiga is so much more advanced than the conventional PC, it's like comparing an old fashioned record player to a compact disc system.

In fact, part of the fascination of owning an Amiga is that we're still finding out how far we can push it.

Exciting new programs and applications are being developed all the time as we explore the Amiga's outstanding computing and graphic capabilities. That's why you'll find membership to Club Amiga so rewarding. You'll receive a Commodore Amiga Review each month and the Commodore Amiga Review annual to keep you informed of the latest developments in Amiga applications and software.

You'll also be receiving a regular Club Amiga newsletter to keep you up to date with the latest developments.

In fact, if you join Club Amiga right now, you will receive, at no extra charge, an exciting software package worth $99.

That's worth more than half your membership fee already! That's just one of the ways Club Amiga will help you get the most from your Amiga system.

So why not do the smartest thing since buying an Amiga. And join the Club!

MEMBERSHIP OPEN TO: COMPANIES, INDIVIDUALS, AMIGA USER GROUPS, SCHOOLS AND TERTIARY INSTITUTIONS.

BONUS GIFT

Join Club Amiga now and receive a Textcraft Plus or Graphicraft program at no extra charge. (Each program normally retails for $89.)

Membership includes one year's subscription to Commodore Amiga Review and Commodore Amiga Review Annual, newsstand value over $42.

SUBSCRIBE NOW AND CLAIM YOUR BONUS.

DFL 59.95

Where in the U.S.A. is
Carmen San Diego?
This package includes Fodor's
USA travel guide. Use this to
stop Carmen from stealing the
national treasures. There are
10 different detective levels.
DFL 59.95

Where in the U.S.A is
Carmen San Diego? School
Version.
Stop Carmen from stealing the
national treasures. To help
you, use the Fodor's USA
Travel Guide and advance
through 10 different detective
levels.
DFL 79.95

Where in the World is
Carmen San Diego?
You have 7 days to chase the
criminal to her hideout with a
warrant for arrest. Family
favourite and winner of many
awards.
DFL 59.95

Where in the World is
Carmen San Diego? School
Version.
Chase Carmen over the globe
using your Crime Computer
to work out the clues and The
World Almanac. Learn about
geography, history and
culture as you travel.
DFL 79.95

Where's Baby Bear?
Junior primary illustrated
adventure, with resource
pack. Imagination and
problem solving skills.
SAT 40.00

Which Number is Missing
Identify the missing number
in a three number sequence
There are three levels of play
and animation is also featured.
Ages Grade Kindergarten –
Grade 1)

PAC19.95

Women's Series
Four databases on: Australian
Women, Women in Science,
Women in Society and
Women in Sport.
SAT 40.00 each, 4 for 90.00

Word Attack!
Teaches new words,
definitions and their usage
and is effective for all ages
and skill levels. Word Attack!
has 675 words grouped into
nine levels. 27 word lists
including adjectives, nouns
and verbs. Editor feature.
DFL 69.95

Word Attack! Data Disks
Grades 4-5, Grades 6-7,
Grades 8-9 and Roots and Pre-
fixes are available also.
DFL 34.95

Word Hunt
To improve reading
comprehension at primary
school age. Children guess
what words are missing in a
passage of text.
SAT 40.00

Word Hunt Companions
Vols I and II - six passages
from 12 books. Vol 3 - 64
nursery rhymes.
SAT 40.00 each

Word Invasion
Practice in identifying words
representing nouns,
pronouns, verbs, adjectives,
adverbs and prepositions by
controlling the magic ring of a
alien octopus.
DFL 39.95

Word Man
With the aid of a maze
students are provided with
practice in forming words
with consonant-vowel-
consonant and consonant-
vowel-consonant-silent e
patterns.
DFL 39.95

Word Master
Identify pairs of antonyms,
synonyms and homonyms at
three difficulty levels.
DFL 39.95

Word Radar
Match basic sight words by

giving students the role of a
control-tower operator
scanning words which
increase in length.
DFL 39.95

Word Usage Tutor
Practice in identifying
mistakes in word usage. The
program focuses on common
errors. Grade 2 - 6.
PAC19.95

World Wide
Databases of demographic
and economic statistics for 165
countries. Further databases
can be created.
SAT 40.00

Genealogy

Family Tree
Control data on the family
tree with features such as 1200
individual files per data disk,
use several data disks for
unlimited genealogies,
alpahbetical and numeric
index, search, produce family
record sheets, etc.
CMT 89.95

Geos

Geocalc 128
A number crunching
spreadsheet, GEOS
compatible, for tracking and
analyzing numerical
information. You can create
your own formulas, and
perform "what if" cost
projections as well as simple
geometry calculations.

CMT 79.95

Geocalc 64
A GEOS compatible
spreadsheet which performs
simple geometric calculations
to "what if" cost projections.
CMT 59.95

GeoChart 64/128
GEOS based chart generator.
Includes nine chart types,
import data from GEOS
applications, change chart
type quickly without affecting
data, add, delete or change
text and any time. As well as
many more features.
CMT 49.95

GeoDex
Create lists by name, address,
phone number and more.
Also includes GEO-Merge,
and is GEOS compatible.
CMT 49.95

GeoFile 128
Database manager to sort, edit
and prioritize information.
GEOS compatible. CMT 79.95

GeoFile 64
A GEOS compatible database
manager to sort and define
priorities.
CMT 59.95

GeoProgrammer V2
An assembly language
authoring tool and debugger
which takes full advantage of
the memory space available in
both C64 and C128.
CMT 79.95

GeoPublish
Features include the ability to

Doodle

format columns, text flows around graphics, many fonts and font sizes, text justified within columns, import and rescale graphics, vertical/horizontal printing, flow borders around text
CMT 59.95

Geos 128 V2.0
Includes new applications such as GeoWrite Workshop, GeoSpell which were formerly sold separately. Easy to use icons, pull down menus and windows. WYSIWYG orientation. Fully compatible with other Geos products
CMT 89.95

Geos 64 V2.0
Berkely Softworks has improved exisitng applications and included new applications, such as GeoWrite Workshop and GeoSpell, formerly sold separately. Easy to use icons, pull down menus and windows. Compatible.
CMT 89.95

Geos Cheatsheet for C64/64C
CMT 9.50

Geos Desk Pack 1 64
Includes four GEOS compatible applications. Use the Graphics Grabber to import art from Print Shop, Newsroom and Printmaster graphics. Also includes Calender, Icon Editor and Black Jack Dealer.
CMT 1239.95

Geos Desk Pack Plus 128
This member of the GEOS family will import art from Print Shop, Newsroom and Print Master with its Graphic Grabber. Also includes a Calendar, Icon Editor, Black Jack, geoDex/geoMerge and will run in 40/80 columns.
CMT 39.95

Geos Font Pack Plus 128
This is a collection of 53 fonts for use with GEOS applications and will run in both 40/80 column mode.
CMT 39.95

Geos Font Pack 1 64
A collection of 20 more fonts for use with GEOS, in various shapes and sizes.
CMT 39.96

Geos Int'l Font Pack 64/128
25 fonts for use with GEOS, GEOS 128, GeoWrite Workshop, GeoWrite Workshop 128 and GeoPublish. Supports Spanish, Danish, French, German, Swiss, Swedish, Italian and English (U.K. and U.S.)
CMT 39.95

GEOS Upgrade
Upgrade to GEOS on Disk Magazine Suite 64 Number 12
PRI 0.00

Geos Writers Pack 64
Pack includes GEOS 64 V1.3, GeoWrite, GeoSpell, GeoDex Desk Pack 1 & Font Pack 1
CMT 149.00

Geospell
Locate and correct words in GeoWrite documents. Check the entire file or only part of the file. Includes a 28,000 plus word GeoDictionary that you can update and edit, and GeoFont with font sizes up to 48 point.
CMT 39.95

Geowrite 128
Menu driven via drop down menus and pointer controlled by joystick or mouse. Supports multiple drives, i.e. 1541, 1571, and 1581 and also RAM expansion. Full WYSIWYG.
CMT 79.95

Geowrite 64
Menu driven by drop down menus. Pointer control via joystick or mouse. Supports multiple drives.
CMT 59.95

Graphics

Animation Station
Graphics Pad.
CMT 139.00

Art Gallery I & II -
Printmaster
CMT 49.95

Art Gallery II - Printmaster
CMT 39.95

Blazing Paddles
Graphics program complete with Lightpen, draw onto the screen itself. Easy to use, ideal for children
CMT 44.95

Clip Art Collection Volume 1
Allows you to expand the capabilities of The Newsroom with art for any occasion
DFL 44.95

Clip Art Collection Volume 3
Sports and recreation clipart for The Newsroom.
DFL 44.95

Clip Art Collection Volume 2
Business and occupations clipart for The Newsroom.
DFL 44.95

Doodle
Hi-res only rawing package. Lots of on-screen help and

semi-menu driven. Pictures may be printed.
CMT 59.95

Flexidraw 5.5
Create professional quality graphics using data entry device of your choice. Supports a light pen, koala pad joystick and mouse. Input devices sold separately
CMT 59.95

Flexidraw Graphics Galleria I
Series of clip art and illustrations which support both Flexidraw and Doodle formats or can be used with Graphics Integrator 2 to convert to Print Shop etc. Individual theme disks.
CMT 49.95

Flexidraw Graphics Galleria II
Individual theme disk to support Flexidraw or Doodle formats. Themes include Borders and Signs, Holiday Themes, Maps of the World, Clip Art Potpourri I & II, with new releases Animals, Futuristic Encounters.
CMT 49.95

Flexifont
Icon and font generating program for use with Flexidraw. Font Capture Program also included.
CMT 49.95

Graphics Expander Volume 1
For use with The Print Shop and Printmaster. More than 300 new graphics and powerful drawing and editing tools to combine/modify/ create graphics. Turn hi-res pictures into usable graphics - Print Shop/Printmaster
DFL 54.95

Graphics Utility
CMT 65.90

Lightpen
Inkwell 184C. Provides easy to use, natural way of entering data that adults and children can quickly master. Demonstration software and technical data is included.
CMT 119.00

Masterpiece

Masterpiece

As well as standard graphic features you can zoom, move, copy scale, rotate and twist/fold pictures in 3D Includes a comprehensive manual. Control the pictures you produce from BASIC to add to your programs.
CMT 49.95

Print Power
Similar to Print Master and Print Shop.
PAC 49.95

Sketchpad 128
80 Column drawing system for the 128. Features include smooth, freehand drawing; lines, boxes, rays, circles and arcs; 640 x 200 res drawing screen; shaded fill patterns; fonts; clipart; full printer support, etc.
BRI 39.00

Slide Show 1 & 2
Various pictures.
PRI 8.00

Slideshow One
PRI 8.00

Slideshow Two
PRI 8.00

The Artist
Electronic painting set to create and print colourful art. Includes sprite designer.
PAC 19.95

The Graphics Integrator
For use with Animation Station, Flexidraw, GEOS, Newsroom, Doodle, Printshop, Printmaster, Cadpak 64, Blazing Paddles and Billboard Maker. Create slideshows or use pictures in Paperclip.
CMT 49.95

The Graphics Magician Junior
Ideal for someone who does not need the programming features of Graphics Magician Painter/Animator, or 3D text options of The Complete Graphics System.
DFL 39.95

The Graphics Magician
A painter and animator with a full palette of colours. Includes a mixing feature allowing over

Commodore Annual 1990

70 blends, 8 different brushes, text entry, and 6 types of moves that the artist can use to create animation.
CMT 19.95

The Print Shop Graphics Library #2
This disk includes symbols for hobbies, occupations, travel, music and health, and much more.
DFL 39.00

The Print Shop Graphics Library #3
This all-purpose disk provides over 100 new graphics including zoo animals, business and international symbols, and the different seasons.
DFL 39.00

The Printshop Graphics Holiday Disk
Holiday graphics including 10 new typefaces, 14 border and 12 full panel designs.
DFL 39.00

Hardware

Accelerator Drives
MIC $199.00

Azimuth 3000 Datasette Alignment Tape
Re-align your cassette deck simply by following the step by step picture guide. All software, instructions and tools are supplied in the kit as well as the game Joe Blade.
OZI/CMT 26.95

C64 Kernal
HPD 9.50

C64/128 RF Cable 3m
CMT 5.95

C64/128 Serial Cable 3m
CMT 9.95

Cartridge Port Expander
4 Slot.
CMT 59.95

Cassette Head Cleaner
ECP 2.95

Datasette Backup Board
DCL1
HPD 29.95

Datasette Doctor

Enables servicing of Datasette unit.
HPD 34.50

Datasettes
Reliable datasette for the C64 with Write L.E.D.
PAC 49.95

Disk Drive Alignment Kit 1541/1571
CMT 44.95

Disk Drive Head Clean Kit 5.25"
CMT 19.95

Disk Notcher
Use both sides of disks by making an extra notch. for 5.25" disks
CMT 14.95

Drive Doctor 1541/1571
Allows you to check motor speed, head movement, back stop setting, head alignment and stepper motor hysteresis. for the C64/128 and 1541
HPD 42.95

Excelerator Plus
HPD 299.00

Excelerator/Super DOS Upgrade Chip
HPD 25.00

Expansion Interface
ECP 45.95

Four Slot Cartridge Expander
HPD 54.95

Geoprint Cable/User Port Printer Cable
Speed up printing with this six-foot parallel cable. Connects easily to Commodores with fewer wires and no interface box.
CMT 39.95

Joystick Extension Cable

CMT 9.95

M-1 Mouse
Emulate a joystick in any program and includes graphic software.
PAC 59.95

M-3 Mouse
Emulates a joystick, paddles and a proportional mouse. Includes graphic and utility software. Ideal for use with GEOS or the Final Cartridge III.
PAC 89.95

Modem Adaptor
Including ON/OFF switch. Allows use of Hayes/1670 modems.
CMT 39.95

Mouse/Cheese Set
Includes a driver routine for GEOS and comes with its own software.
PAC 129.00

Pactronics Disk Drive
This drive comes with an external power supply, a 12 month warranty and ceramic read/write heads. Also, a Disk Pak is supplied consisting of disk based fast loading/saving system, organizer software and games.
PAC 329.00

Parallel Cable 1541/1571
From user port to 1541 drive beneath ROM.
HPD 32.95

Parallel Printer Cable 2m
CMT 19.95

Parallel Printer Cable Extender
Female to female.
CMT 35.00

Xetec Super Graphix Gold

Parallel Printer Extension Cable
Male to male.
CMT 29.95

Quickdisc + MK II
MIC 54.95

RS 232 Cable
Male to male.
CMT 29.95

RS 232 Cable
Male to female.
CMT 31.95

RS 232 Interface
Use a standard modem with this interface. Plugs into USER port.
CMT 89.95

Six Inch Video Interface Cable
ECP 21.95

Slimline Conversion Case for C64
CMT 19.95

Star NB/ND/NR/NX-15 Serial Interface
Features include front panel operation, auto paper feed, tractor feed, 30 cps NLQ, draft quality 120 cps, expandable 4KB print buffer.
CMT 199.00

Star NL-10 Centronics Interface
CMT 110.00

Star NL-10 Commodore Interface
CMT 110.00

Star NL-10 RS-232/Serial Interface
CMT 199.00

Starcursor Joystick

Telephone Adaptor Plug U.S./Aust.
CMT 4.95

Telephone Extn. Cable U.S./Aust
CMT 4.87

Turbo ROM
Load/save up to 6 times faster than CBM DOS. Full disk copier for multiple copies to a single drive, also a reset switch.
COC 44.00

User Port Extension Cable
CMT 29.95

Userport Expander Card
MIC 33.00

Xetec Super Graphix Gold
This interface has a 32K buffer, and can do a printer dump in 16 sizes and four shades. Inverse printouts are also possible. There are 8 fonts and 9 pitches and proportional printing is also available.
CMT 289.00

Xetec Super Graphix Jnr.
An economical printer interface with NLQ built-in and including 10 printing modes and graphics.
CMT 119.00

Xetec Super Graphix
This enhanced printer interface has NLQ built-in and also includes an 8K buffe14r, 2 downloadable fonts, a reset button and a utility disk with 27 fonts.
CMT 169.00

Integrated

Fleet System 2 Plus
Four applications in one package, including Word

Zoomer Joystick/Yoke

Processing, Dictionary, Thesaurus and Database. Includes built-in 80 column preview, WYSIWYG, Pop-up windows, Mail merge, Search/Replace, Horizontal Scrolling.
CMT 59.95

Home Manager
Features word processor, database manager and notepad/calculator.
PAC 29.95

Kwik Pad
Desktop organiser including database, calculator, diary and memo pad.
PAC 16.95

Mini Office II
Combines word processor, database and spreadsheet.
PAC 44.95

Tri Pack
Combination of The Writer, The Filer and The Planner.
PAC 79.95

Vizastar 128
Spreadsheet - 1000 rows, 64 col., 9 worksheet windows. Database - full screen design (up to 9), 8000 char per record. Graphics - use figures from any user defined worksheet cell range. Many graph types.
BRI 69.00

Wordpro 128
80 column word processor with RGB monitor, also includes Filepro 128 database.
PAC 79.95

Joysticks

Challenger Joystick
Features 6 micro switches, auto-fire switch with 3 speed control, 2 fire buttons, 8 directionial positions with built-in stabilising suction cups. No cables, no tangles. Infra Red Joystick.

Assembler Monitor
Features full 6510 Macro
Assembler to support
user-defined macros and
defines floating point
constrains in ML programs.
The Monitor includes
standard features and switch
memory banks, single step
execution, & more
CMT 59.95

BASIC 8 128
Advanced programming
environment for 128D in 80
column mode. Includes
commands for windows,
fonts, patterns and brushes.
Complete with 200 page
manual, 2 disks, runtime
library, demonstrations, 3
BASIC 8 programs.
BRI 48.00

BASIC 8 Toolkit 128
Collection of utilities for use
with BASIC 8. Also allows you
to convert Print Shop graphics
into BASIC 8 graphic file.
Even add colour with the

colour option.
BRI 29.00

BASIC Compiler 128
Converts programs into
machine language or speed
code.
CMT 89.95

BASIC Compiler 64
Make your BASIC programs
run faster by converting them
into machine language or
speed code, including those
written in Simon's Basic,
Video Basic and more.
CMT 69.95

Becker BASIC
Program in BASIC to run
under GEOS. Adds more than
170 new commands to BASIC.
PAC 59.95

Cobol 128
Programming language
featuring Editor, Interpreter
and Symbolic Debugger,
English-like commands,
powerful programming
development tool. A
comprehensive manual is
included as are sample
programs and exercises.
CMT 69.95

Forth
CMT 59.95

Fortran
Comes complete with own
compiler to produce fast, run-
able and saveable programs.
PAC 69.95

Super C 128
This easy-to-use package
helps you to learn C or dev-
elop new software on your
computer. Includes full-screen
editor, compiler, linker and
handbook, as well as libraries
for graphics and advanced
math.
CMT 89.95

Super C 64
Learn C on your computer.
Produces 6502 machine code
and is faster than BASIC. A
full-screen editor is included
which features search/replace
and block operations. Also a
compiler, liner and handbook
included.
CMT 89.95

Super Pascal 128
A full implementation of
standard Pascal including
features such as such and
replace and the ability to add
machine language routines
with the built-in assembler.
CMT 89.95

Super Pascal 64
A full implementation of
standard Pascal. Editor feat-
ures include search and
replace. Allows the addition
of machine language routings
with built-in assembler. C64
version has high-speed DOS
for faster access.
CMT 89.95

to load, manipulate, combine and save computer images from graphics programs, and will support CEOS, Print Shop, Print Master, Koala Doodle, Flexidraw, Newsroom (and more), formats.
BRI 160.00

Jiffy DOS 128
Available for C128D (speeds up 64/128 modes), also for 1541, 1541C, 1541 11, 1571, 1581, FSD 1&2, MSD SD-1&2, and more. System includes ROMS for computer & 1 drive, stock/JiffyDOS switching system, and instructions.
HPD 0.00

Jiffy DOS C64
Ultra fast disk operating system for the C64, SX64 and C128. Speeds up all disk operations, uses no ports, memory or any extra cabling. 100% compatible with all software/hardware. Easy do-it-yourself installation.
HPD 89.00

Kwik Load
Disk utilities package.
PAC 16.95

Kwik Utility
Disk based, fast loading DOS utilities.
PAC 16.95

MPS 802 Publisher Upgrade
PRI 6.00

MPS 802 Publisher V2
Provides graphic support for 1526 & MPS-802 Printers. Prints Doodle, Printshop, Printmaster graphics. Provides NLQ mode, Banners plus more. Includes Docs.
PRI 24.95

Super 81 Utilities 128/1581
Complete utilities package for 1581 disk drive and 128 Will load on 1581 or 1571 drive, includes a 1581 disk editor, a drive monitor, and a RAM writer. Also performs many CP/M and MS-DOS utility functions.
BRI 49.00

Super Disk Utilities 128
A collection of utilities for the

1571 and 128 grouped into 7 functions: DOS utilities, disk copying, file copying, CP/M utilites, disk editor, drive monitor and RAM writer.
BRI 49.00

Super Printing Utility
ECP 31.95

Word processing

Bank Street Writer
A wordprocessor simple enough for children and at the same time sophisticated enough for adults. Write, revise, correct, erase and unerase, or rearrange your words instantly. Backup disk and manual included.
DFL 79.95

Fontmaster 128
Includes over 50 fonts and utilises the double height feature of some printers to print headlines or titles. Fontmaster will arrange text around graphics, and has a 100,00 spell checker, macro instructions, and more.
CMT 89.95

Fontmaster II
This powerful wordprocessor for the 64 comes with 30 fonts, 65 commands, a font creator, data merging, super and subscripting and italicizing.
CMT 79.95

Kwik Write
Menu driven, full featured word processor.
PAC 24.95

P.W. Dictionary
QUE 29.95

Paperclip
ECP 31.95

Paperclip II
ECP 94.95

Paperclip III
Post-formatting wordprocessor for 64/128. Four way scrolling in video preview. Allows you to define,move, sort, delete and add columns. Automatic reformatting of edit scren after addition/deletion.
ECP 94.95

Paperclip Publisher
ECP 45.95

Paperclip/Spellpak
ECP 1731.95

Pocket Writer II
Menu and command driven with on-screen help, true WYSIWYG. Series II versions use RAM expansion if it is available. Full set of formatting, text enhancement and cursor controls.
QUE 69.95

Super Disk Librarian 64
CMT 34.95

Super Disk Librarian 128

CMT 34.95

Superscript 128
A post-formatting, menu-driven. EasyScript's big brother. The menu system in enhanced by a parallel command system to increase speed. Alpha-numeric keys can be programmed to execute function/s.
CMT 49.95

Superscript 64
CMT 49.95

Tasword
Includes 80 character per line display, WYSIWYG, and on-screen formatting, comprehensive help commands, full cursor movement control, delete, insert, tab, search/replace, program customization to dot matrix.
DOL 39.95

The Write Stuff
WYSIWYG preview, up to 64K divided into 10 work areas. Also includes built-in outline generator, file transfer for other wordprocessing documents, supports 1750/1700 RAM expanders, alarm clock, and much more.
BRI 49.00

The Writer
With pull down menus and 50,000 word spelling checker.
PAC 39.95

Value Word
Word processor for home use which includes 40,000 word spell checker, punctuation guide, letter formats and address and salutation guide.
PAC 29.95

Vizawrite Classic
Vizawrite includes full screen and document scrolling, and allows merging of documents from Easy Script, Paper Clip and Superscript. Multi-line headings and footings with automatic page numbering.
BRI 59.00

Word Publisher
GEOS wordprocessing with more features than Geowrite and 100,00 word spelling checker.
PAC 69.95

Word Style
Easy to learn word processing software
PAC 44.95

Word Pro
Includes turbo load/save and spellchecker.
PAC 79.95

Word Pro 128 with File Pro
80 column word processor for the C128 with RGB monitor. Includes File Pro 128 database program.
PAC

Bulletin Boards of Australia
List published by the Australian BBS Registry - Release 8911

Access information

Mem: Membership required for full access.
Reg: Registration required.
VA: Visitor Access available to most functions.
LVA: Limited Visitor Access available.
Public: Public board, open to all.
File Server: FIDOnet File Server (see below)

Most systems will allow you on to let you know their requirements, the registry specifically does not store exact details of what each system wants for access as the requirements change too often.

Baud information

V21	300 Tx /300 Rx CCITT
V22	1200 Tx /1200 Rx CCITT
V22bis	2400 Tx /2400 Rx CCITT
V23	1200 Tx /75 Rx CCITT
V23ORG	75 Tx /1200 Rx CCITT V23 set to originate
V32	9600 Tx /9600 Rx CCITT
B103	300 Tx /300 Rx Bell (US)
B212	1200 Tx /1200 Rx Bell (US)
PEP	9600+ PEP Protocol Modem
HST	9600+ HST Courier Modem

Unless otherwise shown all systems are 8 bit bytes, 1 stop bit, no parity.

FIDOnet

● FIDOnet is a network of bulletin boards that exchange mail and news. Systems accessible via FIDOnet have their zone, net & node numbers listed. For more information logon to a Fido system, most have full details of the network online for browsing by users.

The registry has a special area within FIDOnet called BBS NEWS. The latest news and changes are always in this area.

File Server

● This is a system that does not have callers as such, what they have are files for downloading using FIDOnet (Binkley, D'Bridge, Front Door, Opus, Seadog, etc) "File Request" processing.

General Information

● The Australian Bulletin Board Registry was formed to attempt to resolve the age old problem of obsolete Bulletin Board lists. Part of the philosophy of the registry is to make it worthwhile for all operators to list their system with the registry and to make use of the listings.

One method of making the listings attractive is that the issue of the lists is totally regular, at the beginning of each month the registry publishes a new version of the listing. This listing is marked with the creation date and time and is also given a release number (this release number is normally the year and month of issue, the January 1987 list would be given a release number of 8701).

The idea of providing the files is that they are available to anyone; sure there is a copyright notice, but that is to protect the viability of the lists, not to stop people using them.

Most Australian Fido systems carry the current list, this is because the Network Coordinators of Fido support the idea of up-to-date listings. This does not mean the lists are Fido only, they are FREE TO ANYONE. Look for the listings on your favourite system, if they are not there ask your sysop to get them for you, otherwise call the state coordinator's bulletin board or try your nearest Fido system. If all else fails dial (02) 628-5222 and get it from Rodney Creer, Australian BBS Coordinator.

Please help eradicate out of date listings, use the registry files, and if you find a system that is not listed advise the registry either by post, through one of the co-ordinators, on the Fido conference BBS NEWS, or by leaving a message to sysop on the Prophet.

THE GREAT COMMUNICATOR™

The direct-connect Hayes® and Commodore® 1670 compatible 1200 Baud modem

Everything from Electronic Mail (E-mail) to stock quotes and huge databases of every imaginable type is now on line to the small computer owner. You can even send and receive messages anywhere in the world. All you need is a telephone and a modem which allows your computer to communicate with others.

Almost all modems (and services) are set up to communicate in one or more of three speeds; 300, 1200 and 2400 Baud. Most computer users prefer 1200 Baud. (1200 Baud is about 4 times as fast as 300 which means you spend about ¼ the time and money getting the data you want and more time enjoying it. 2400 Baud is not presently available with all services.)

What is Hayes® compatibility? It's the industry standard and most all modem manufacturers have adopted the "AT" (Hayes) command set. Beware of those who don't. Virtually all software being written now uses Hayes commands. Be sure the modem you buy is truly Hayes® and Commodore 1670® compatible therefore usable in all situations and with all services. Let's compare Minimodem-C™ with the 1670®, Avatex-e and Volks 6480®

Comparison of	Minimodem-C™ vs.	1670® vs.	Avatex-e vs.	Volks 6480®
Hayes® Compatibility?	100%	Subset Only	Subset Only	None
Commodore direct Connect?	Yes	Yes	No	Yes
Number of Status Indicators	7	0	8	0
Busy Detect?	Yes	No	No	No
DTR Signal Support?	Yes	No	Yes	No
High Speed Detect Line?	Yes	No	No	No
Number of DIP Switches	8	3	8	0
Number of Status Registers	16	3	16	0
Guarantee	1 yr.	90 days	2 yrs.	5 yrs.

Now you have the FACTS to make an informed decision.

What do you get with Minimodem-C™? Everything! You don't need to worry about cables, compatibility or anything else! The Aprotek Minimodem-C™ (#6212) plugs directly into your Commodore C-64, C-64C or C-128 USER port. It is unique in that it has two separate (switchable) emulation modes (Hayes and Commodore 1670®) to make it compatible with ALL available software. The Minimodem-C™ is a full feature, 300/1200 Baud modem with Auto Answer, Auto Dial, Touch-Tone or rotary dialing, has status indicators and a built-in speaker. Just plug it into your computer and standard phone jack with the attached cable. Minimodem-C™ is supplied with "Multiterm" terminal software and a free trial subscription to Compuserve.

Do you have more than one computer or do you plan to get another computer? We have your solution. Simply order our new Com-Modem™ adapter (#5100) along with the standard Aprotek Minimodem-H™ (#6214) which you can use with any computer that has a RS-232 serial port as well as with your Commodore. Aprotek Minimodems™ are tiny. Only 4¾" long, 2¾" wide and ¾" high. Our highly integrated, state-of-the-art circuitry makes this modem a Best Buy.

MINIMODEM SPECIFICATIONS

DATA RATE:	1200, 0-300 bps	DYNAMIC RANGE:	37dB	**SOFTWARE FEATURES:**
MODULATION:	PSK @ 1200, FSK @ 0-300	OPERATING ENVIRONMENT:	0°C to 50°C (32°F to 122°F)	• Send/Receive ASCII Files and Basic Files.
COMPATIBILITY:	Bell 212A/103 & CCITT V.22/V.21, V.22 notch filters included	SIZE:	4.75"x 2.75"x .75"	• Menu driven configuration.
		WEIGHT:	4 oz.	• Zero learning time.
OPERATIONAL MODES:	2-wire Full Duplex, Auto Dial, Auto Answer, Auto Redial.	POWER:	Powered from computer (-C) or by wall plug (-H, -AM)	• Upload/Download capability for program exchange
DATA FORMAT:	Asynchronous, bit-serial	WARRANTY:	One year limited warranty	• Supports most popular protocols.
DATA INTERFACE:	Direct connect with computer specific versions. RS-232C.	COMMAND SET:	Hayes® AT including complete "S" registers and result codes, and self test.	• 7 or 8 bit word length.
TELEPHONE INTERFACE:	RJ-11 line plug			• 1 or 2 stop bits.
CARRIER SENSITIVITY:	On at—43dBm, Off at—48dBm			• Odd, even, mark, space or no parity.
